

Muon Performance in the CMS Detector Using First 7 TeV Data

CMS Experiment at LHC, CERN
Run 135149, Event 125426133
Lumi section: 1345
Sun May 09 2010, 05:24:09 CEST

Muon $p_T = 67.3, 50.6$ GeV/c
Inv. mass = 93.2 GeV/ c^2

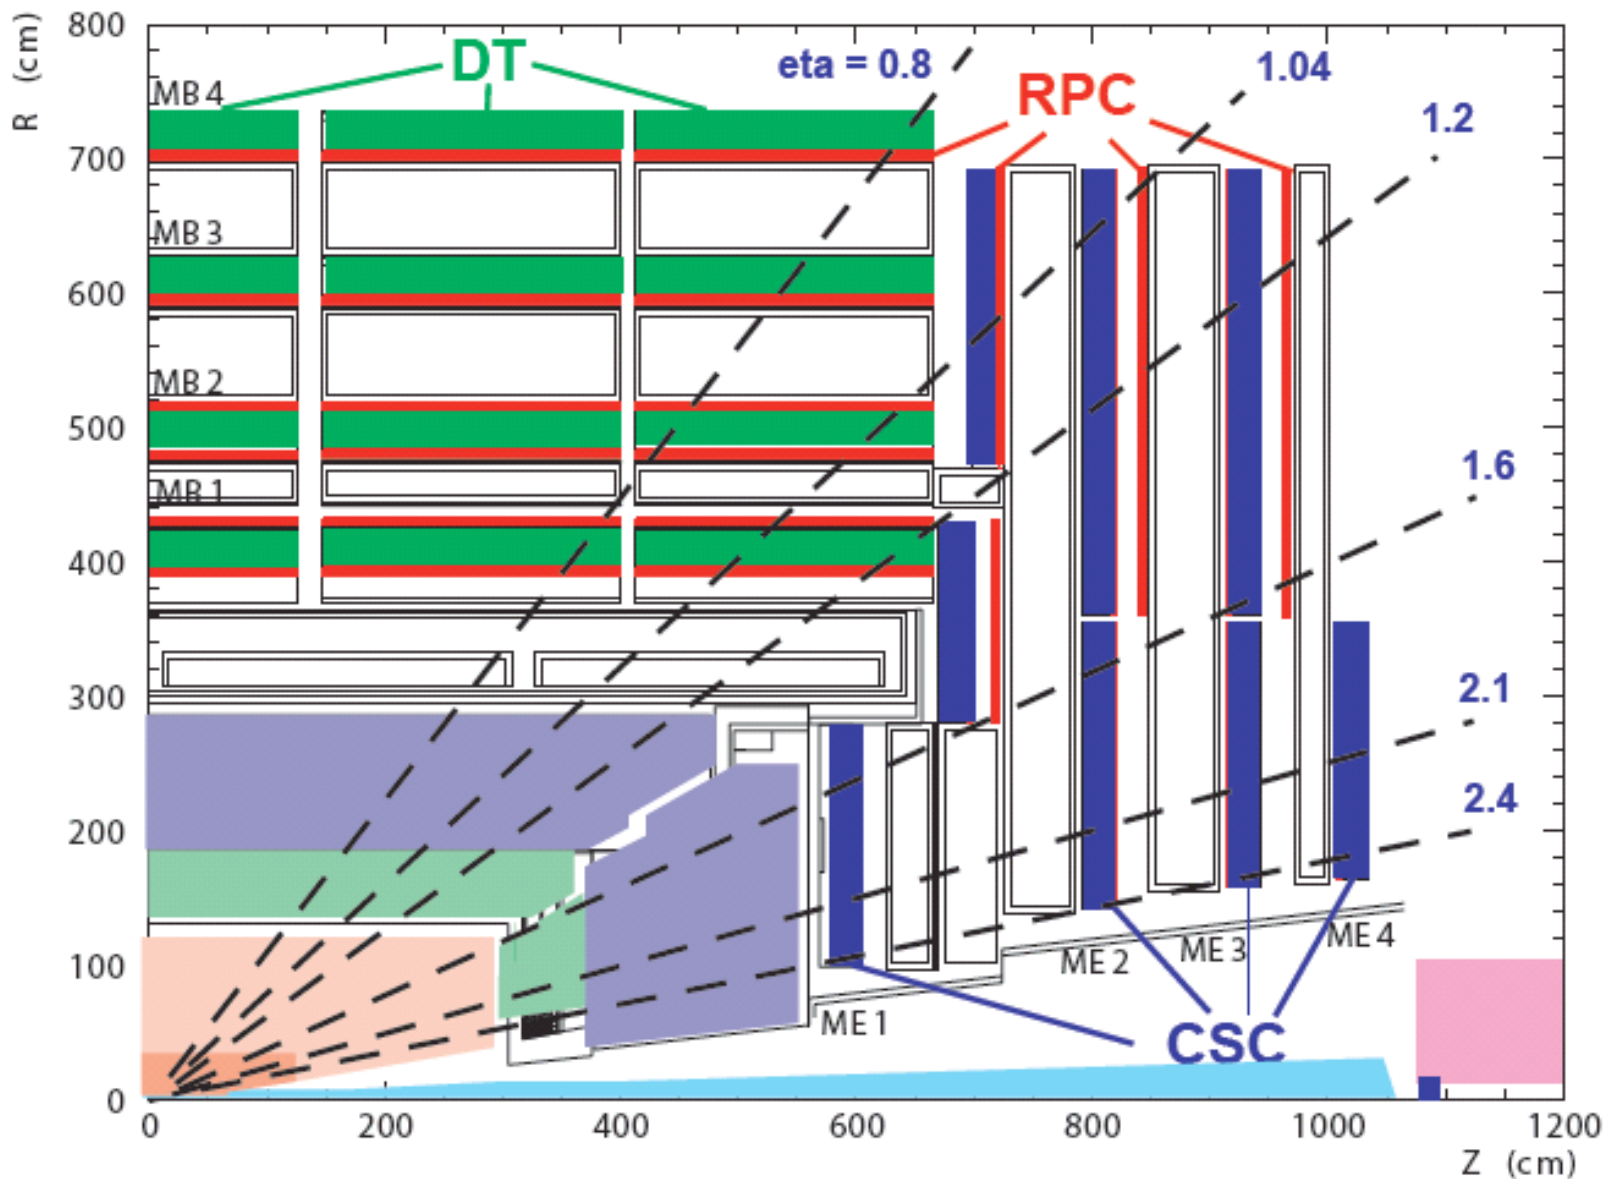

Rachel Wilken

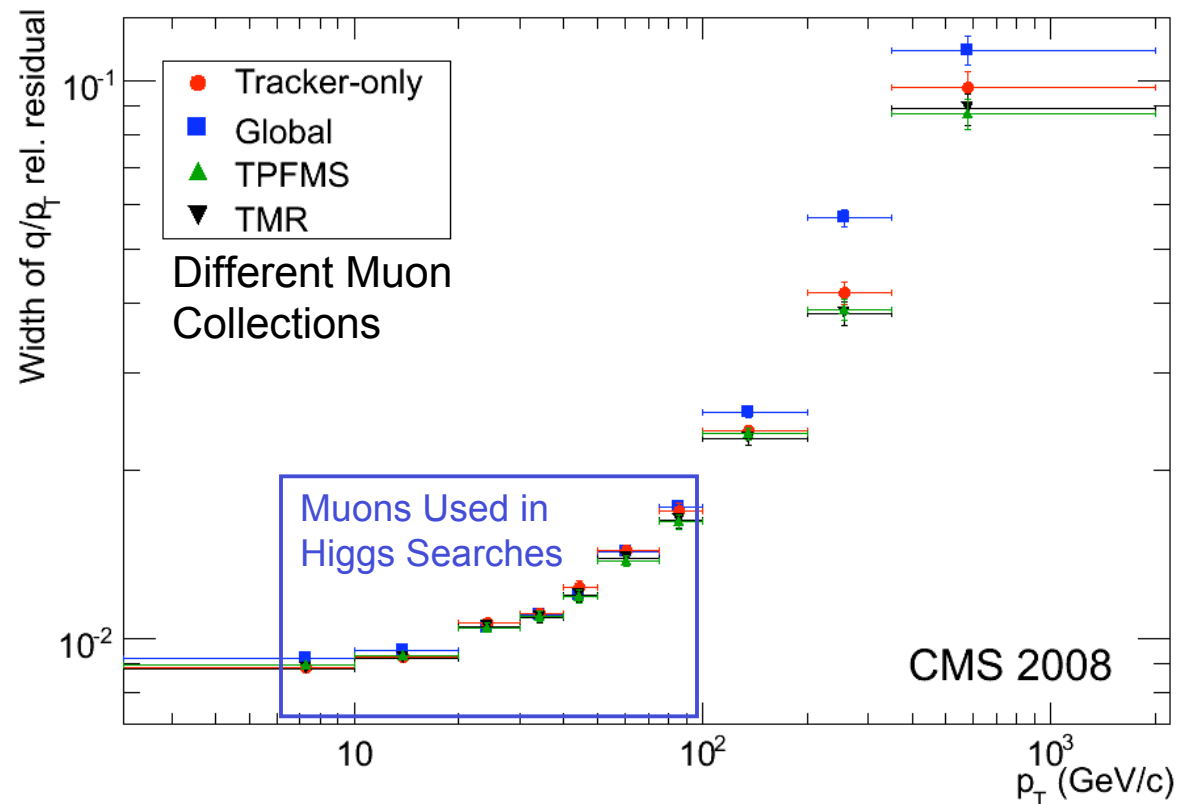

**University of California Riverside
On behalf of the CMS Collaboration**

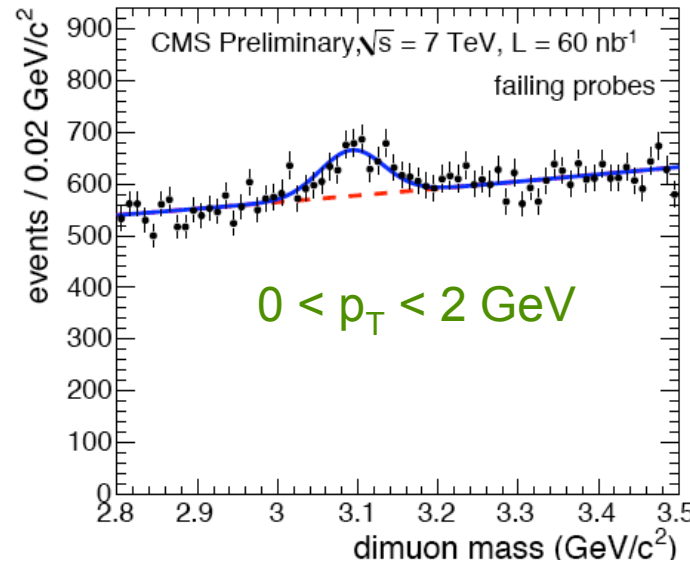

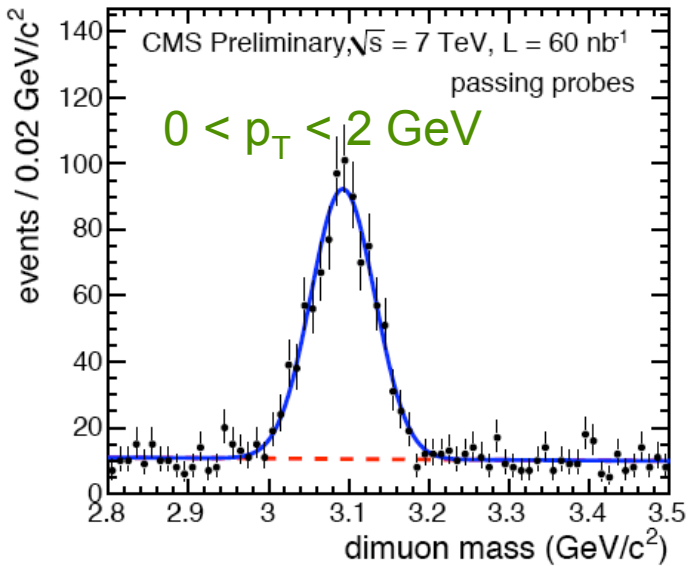

Muon Geometry

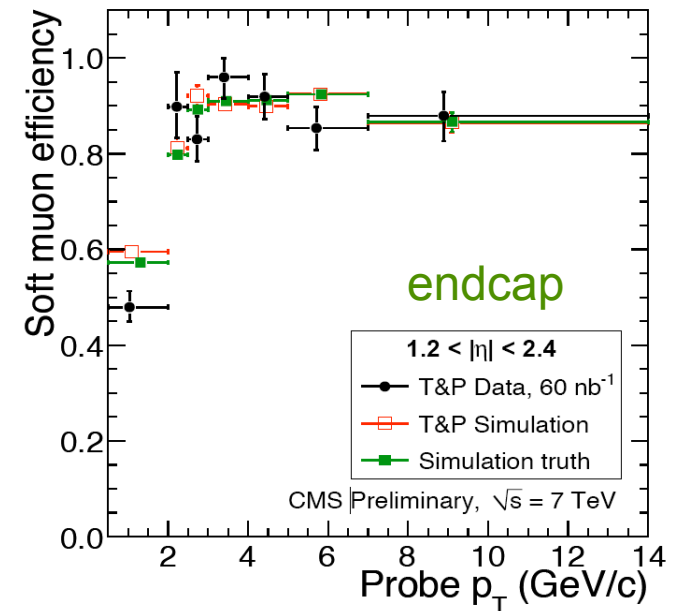

- 270 million cosmic events to make muons best understood reconstructed object in CMS
- Compare track p_T in upper and lower halves of detector
- 8% resolution at $p_T = 500$ GeV
- 1% at 10 GeV

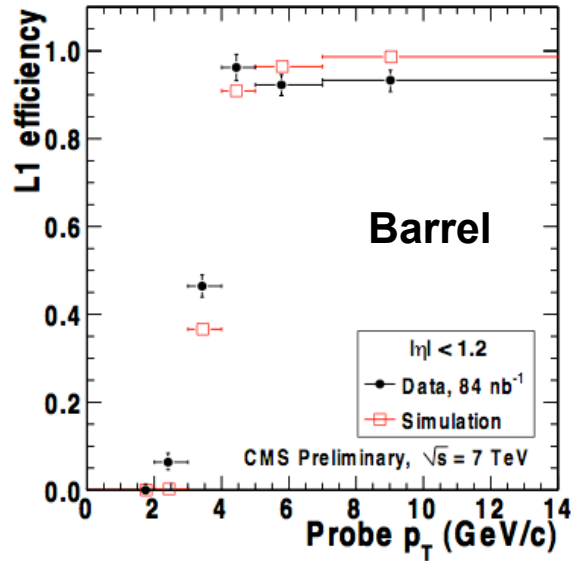

Using $J/\psi \rightarrow \mu\mu$
resonance
 $2.8 < m_{\mu\mu} < 3.5$ GeV

- Tight Selection on tag muon
- All probes required to have a tracker track
- Perform combined fit to “passing” and “failing” line shapes in order to subtract background

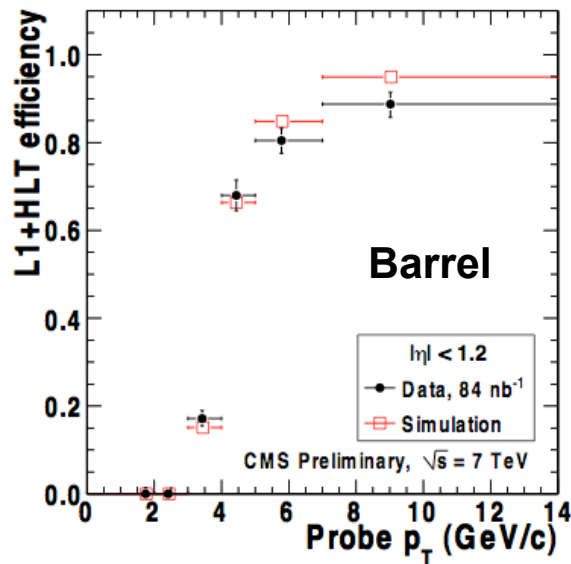

Trigger Efficiency

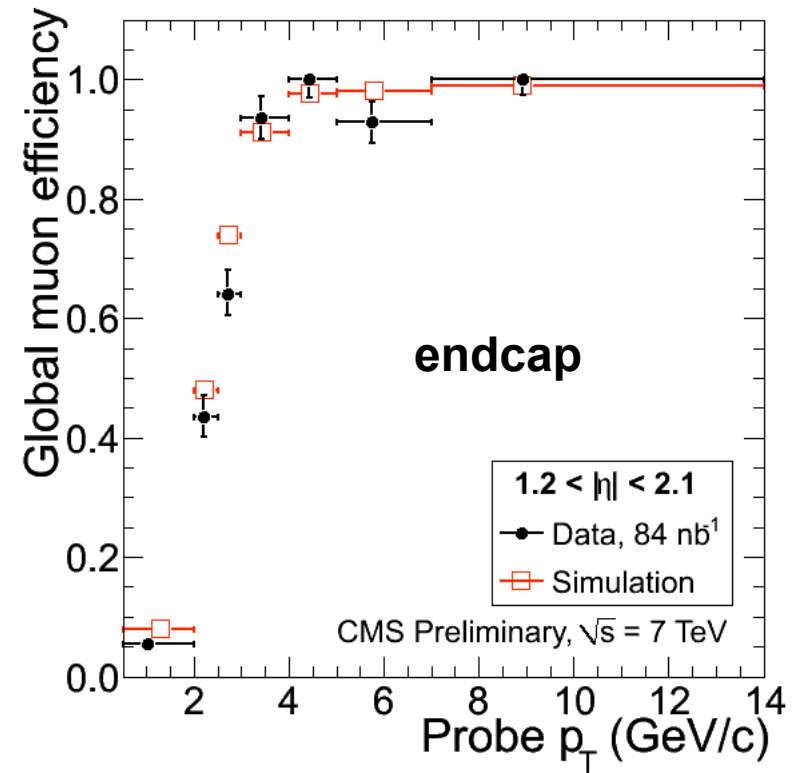

Level 1
Trigger

High
Level
Trigger +
Level 1

- Tag and Probe study using $J/\psi \rightarrow \mu^+ \mu^-$

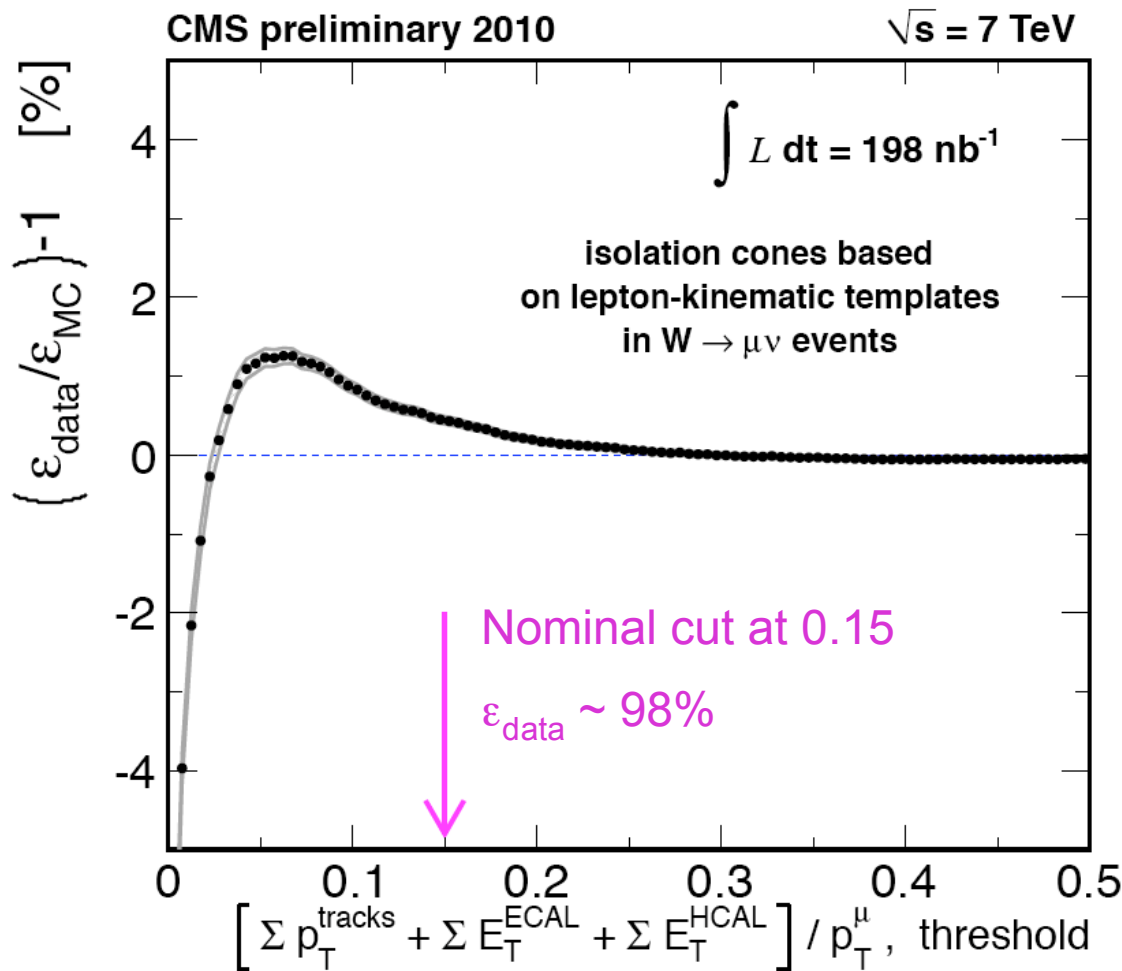

CMS fully efficient at ~5GeV

Muon Isolation

- Lepton-kinematic templates method used to calculate isolation efficiency

- Lepton-kinematic Templates use pre-defined directions from MC to estimate isolation in data
- Isolation calculated using 100 lepton-kinematic templates for each $W \rightarrow \mu\nu$ data event
- If template falls within 0.6 in eta and phi of muon then event thrown out

Momentum scale: $J/\psi \rightarrow \mu^+ \mu^-$

Mean from data =
 3.0927 ± 0.0005 GeV

PDG mass =
 3.0969 ± 0.000011 GeV

- Use sample to further understanding of muons in CMS
 - Tag and Probe
 - Momentum scale corrections
 - Mass as a function of η and p_T
 - Material in the detector
 - Impact parameter and secondary vertices

$\sigma(pp \rightarrow W+X \rightarrow \mu\nu+X) =$
 $9.14 \pm 0.33(\text{stat}) \pm 0.58(\text{syst}) \pm 1.00(\text{lumi}) \text{ nb}$
 SM $\sigma(pp \rightarrow W+X \rightarrow \mu\nu+X) = 10.44 \text{ nb}$

$\sigma(pp \rightarrow Z(\gamma^*)+X \rightarrow \mu^+\mu^-+X) =$
 $0.881 \pm 0.104(\text{stat}) \pm 0.042(\text{syst}) \pm 0.097(\text{lumi}) \text{ nb}$
 SM $\sigma(pp \rightarrow Z(\gamma^*)+X \rightarrow \mu^+\mu^-+X) = 0.97 \text{ nb}$

Conclusions

- Muons well understood using first 7 TeV data
 - Trigger
 - Reconstruction
 - Isolation
- Impressive agreement between simulation and data
- Understanding muons from W and Z is the first step to finding the Higgs in WW and ZZ channels

CMS is well on its way!
