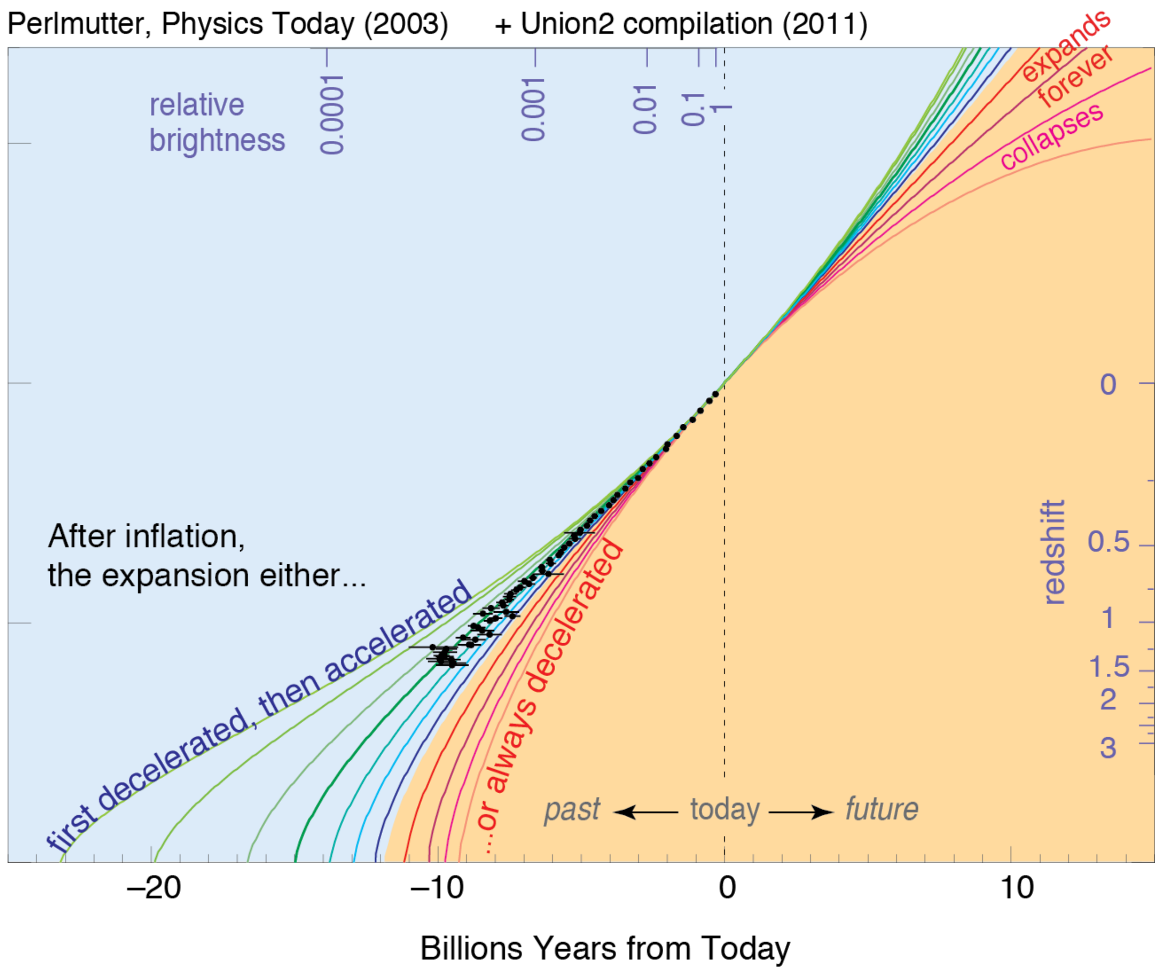
How We Know there is Dark Energy



GR & Cosmology in One Slide

Alexander Friedmann

$$\frac{\ddot{a}}{a} = \frac{\Lambda}{3} - \frac{4\pi G_N}{3}(\rho + 3p)$$

$$\left(\frac{\dot{a}}{a}\right)^2 = \frac{8\pi G_N \rho}{3} - \frac{k}{a^2} + \frac{\Lambda}{3}$$

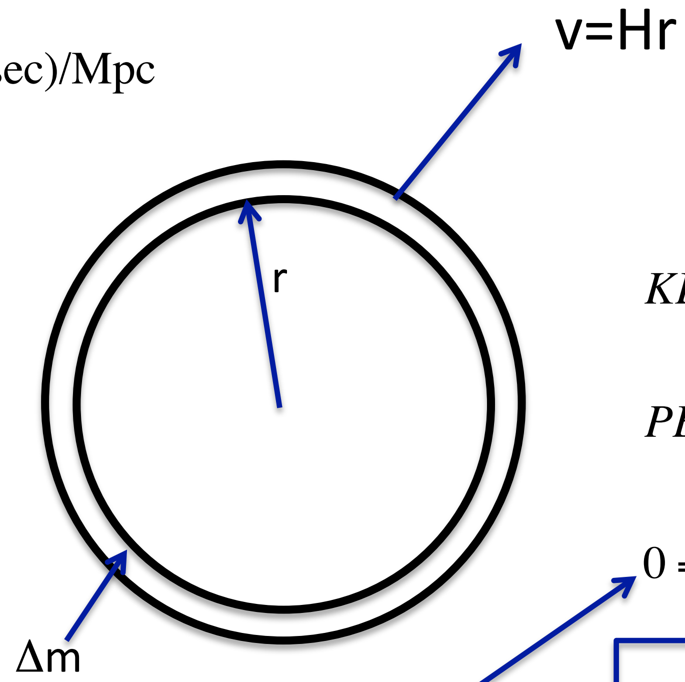
a is the size-scale of the universe relative to size today

Monseigneur Georges Henri Joseph Édouard Lemaître

Cosmological constant = “Einstein’s blunder”

Making the Universe Collapse

$$v = Hr$$
$$H = h \times 100\,(\text{km/sec})/\text{Mpc}$$
$$h \approx 0.7$$



$$KE = \frac{1}{2}\Delta m v^2 = \frac{1}{2}\Delta m (Hr)^2$$

$$PE = -\Delta m \left(\frac{4\pi r^3 \rho}{3}\right)\frac{G_N}{r}$$

$$0 = \frac{1}{2}H^2 - \left(\frac{4\pi\rho G_N}{3}\right)$$

$$\rho_{critical} = \frac{3H^2}{8\pi G_N} = 1.05 \times 10^{-5} h^2 \text{ GeV cm}^{-3}$$

Zero total energy. Just enough to stop expansion.

Energy Budget of the Universe

- Re-write Friedmann-Lemaitre equation:

$$\Omega_m + \Omega_{rad} + \Omega_\Lambda + \Omega_k = 1$$

$$\Omega_m = \frac{\rho_m}{\rho_{crit}} \qquad \Omega_{rad} = \frac{\rho_{rad}}{\rho_{crit}} \qquad \Omega_\Lambda = \frac{\rho_\Lambda}{\rho_{crit}} \qquad \Omega_k = -\frac{k}{H_0^2}$$

$$H(a) = \frac{\dot{a}}{a} = H_0 \sqrt{a^{-4}\Omega_{rad} + a^{-3}\Omega_m + a^{-2}\Omega_k + a^{-\varepsilon}\Omega_{DE}}$$

distance →

$$D(a) = \int_a^1 \frac{da'}{a'^2 H(a')} = \int_0^z \frac{dz'}{H(z')}$$

Dark Energy Equation of State

$$w(a) = p / \rho$$

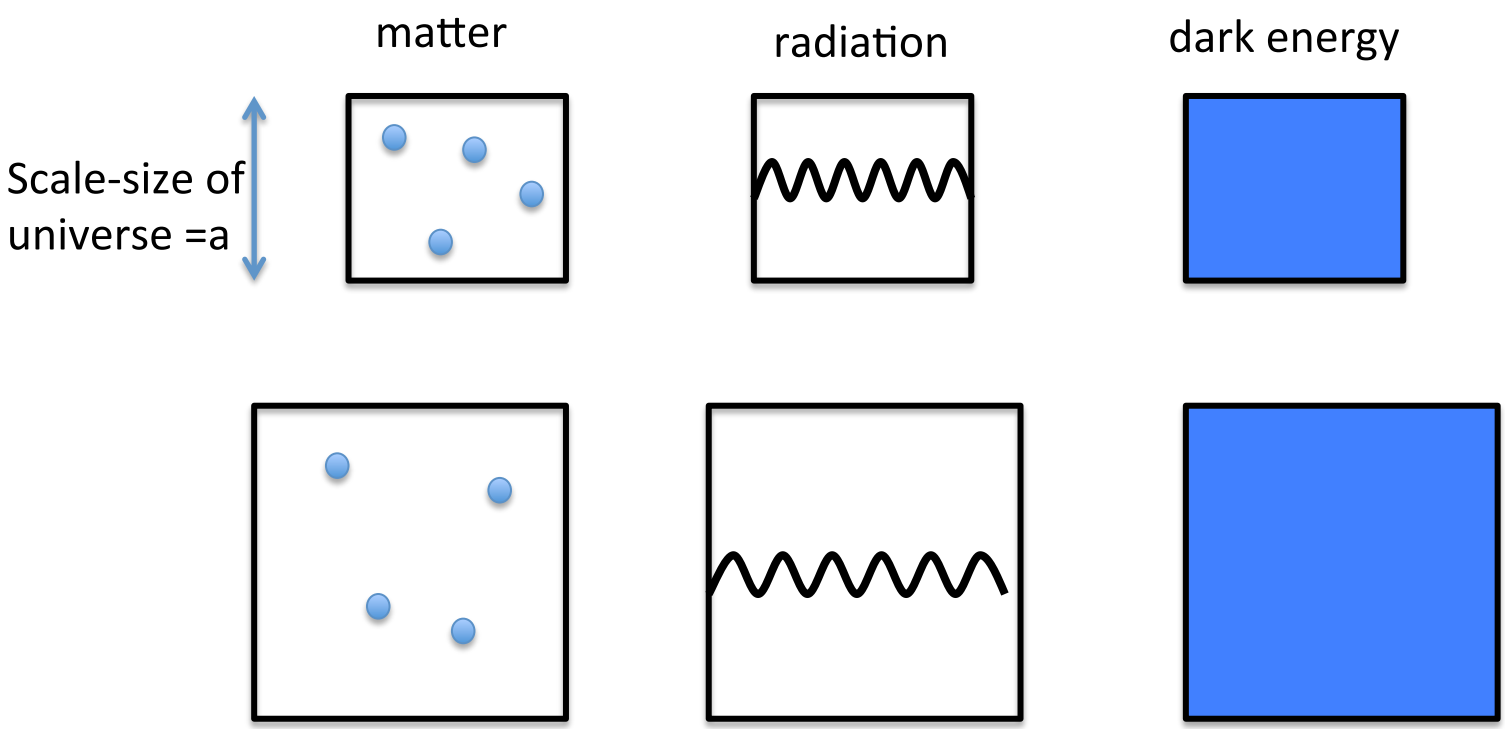
From Friedmann-Lemaitre Equations

$$\frac{d\rho}{dt} = -3(1 + w(a))\rho \frac{da}{dt} \qquad \rho(a) = \rho(a = 1)e^{3\int_a^1 \frac{da}{a}(1+w(a))}$$

Matter: w=0   Radiation: w=1/3   Cosmological constant: w=-1

Accelerating Universe means w < -1/3 or
General Relativity fails.

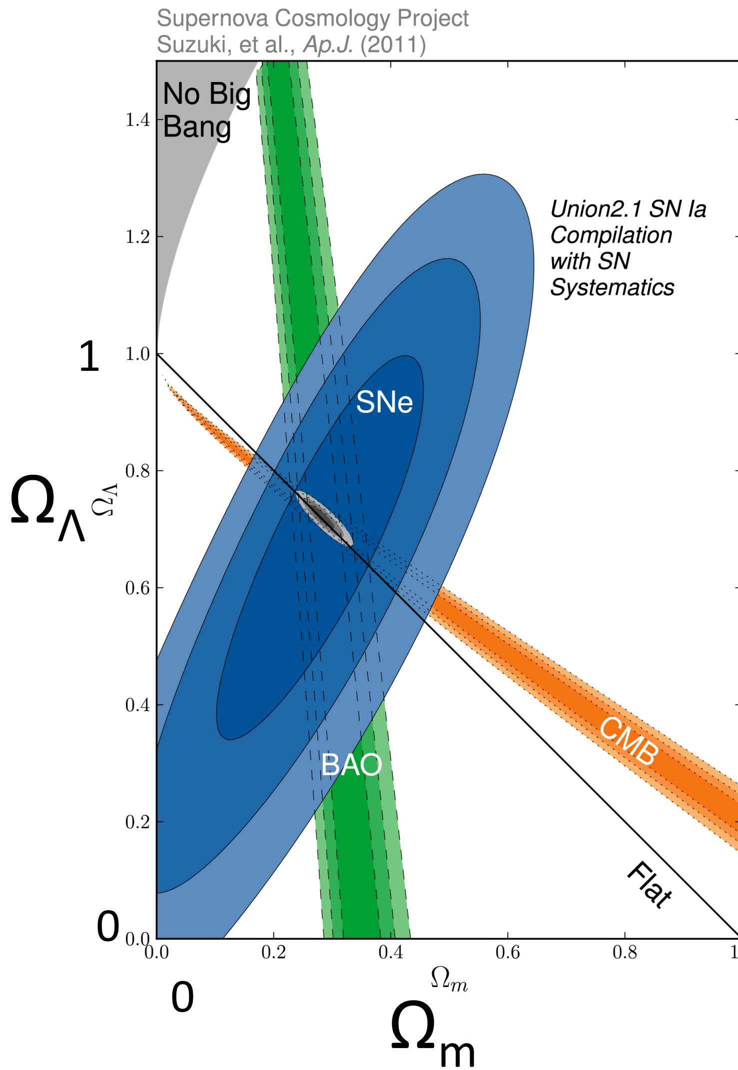
Dark Matter vs Dark Energy



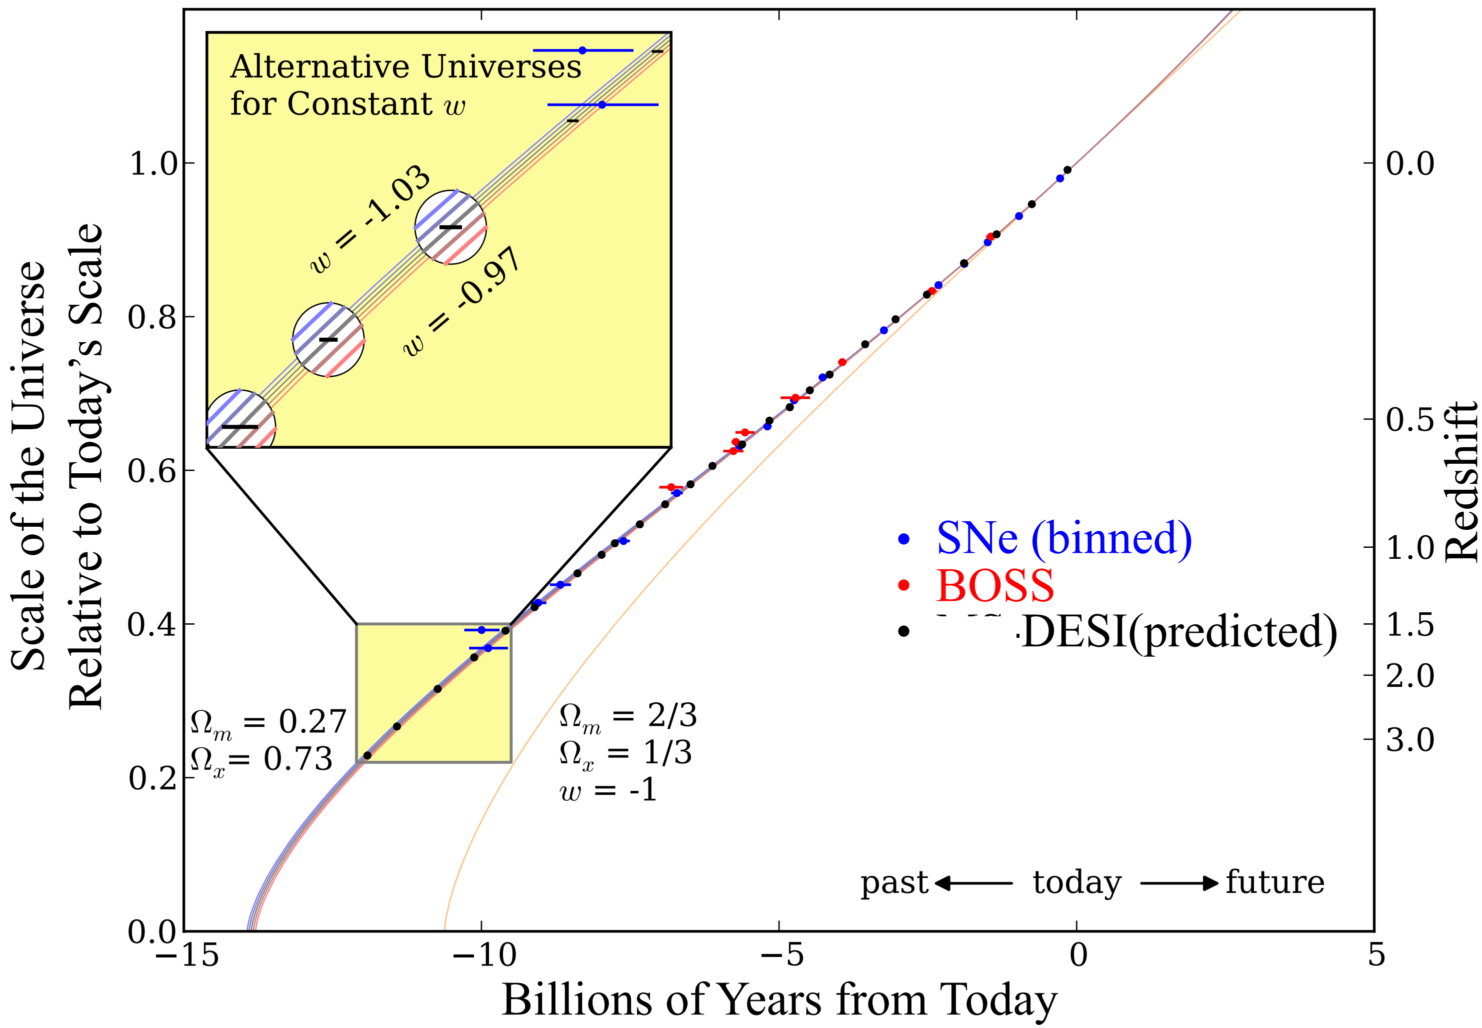
$\rho \propto a^{-3}$ $\rho \propto a^{-4}$ $\rho \propto a^{0}$

Energy Budget of Universe

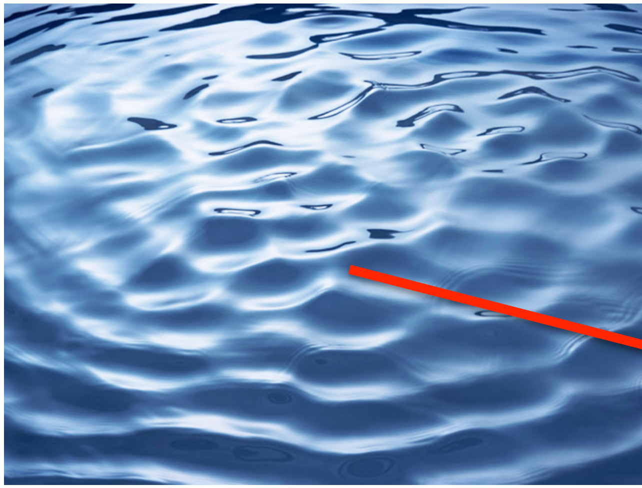
- Combining three kinds of measurements we learn that
  - The Universe is flat.
  - 32% of energy is matter.
  - 68% of energy is “dark” .
- Distribution of elements tells us only 5% of energy is ordinary matter.
  - 27% of energy is due to “dark matter”



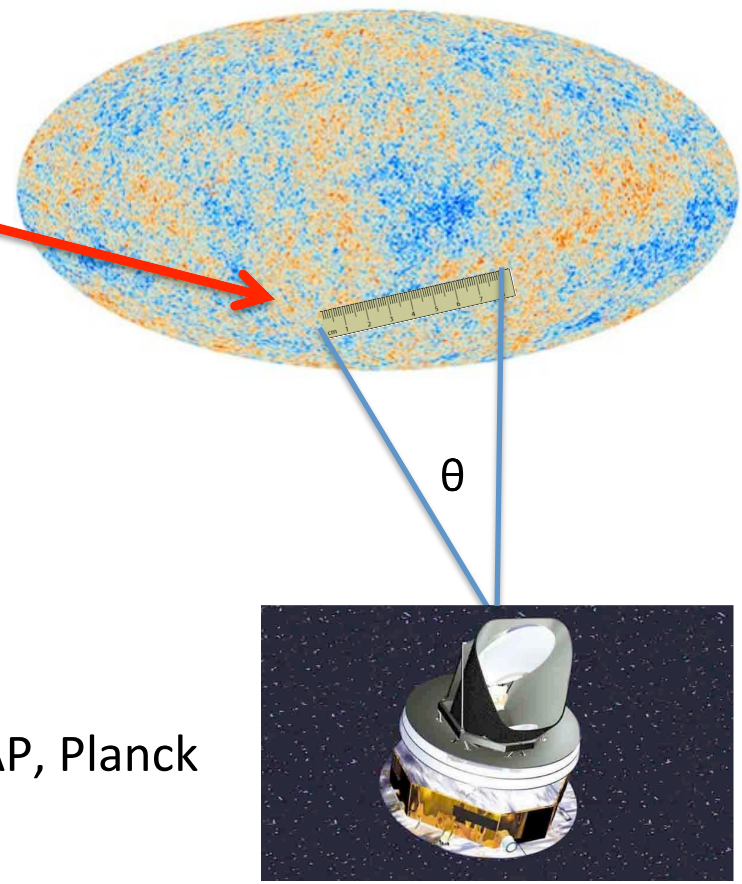
How Hard is it to Rule out Cosmological Constant?



Tiny Ripples in Early Universe



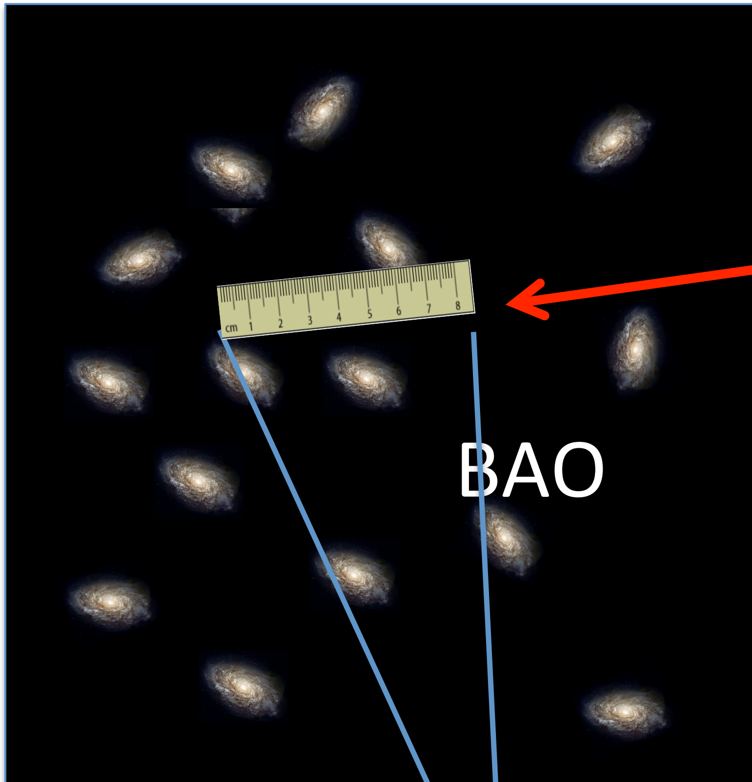
Cosmic Microwave Background

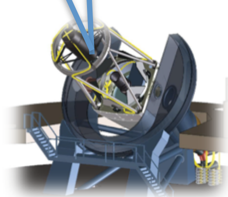


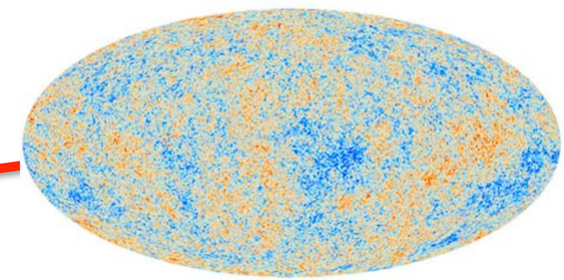
Ripples in early universe imprint standard ruler in cosmic microwave background

COBE, WMAP, Planck

BAO gives Ruler

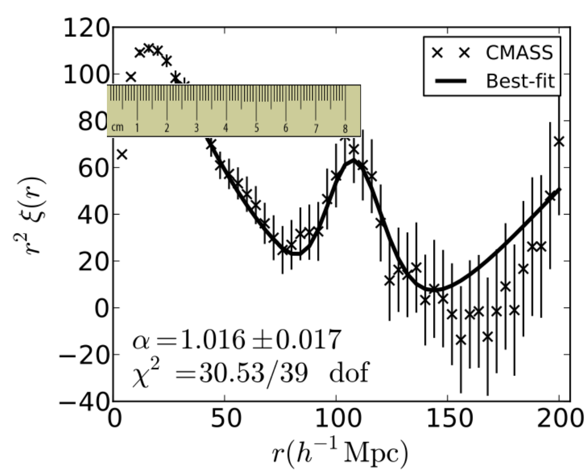






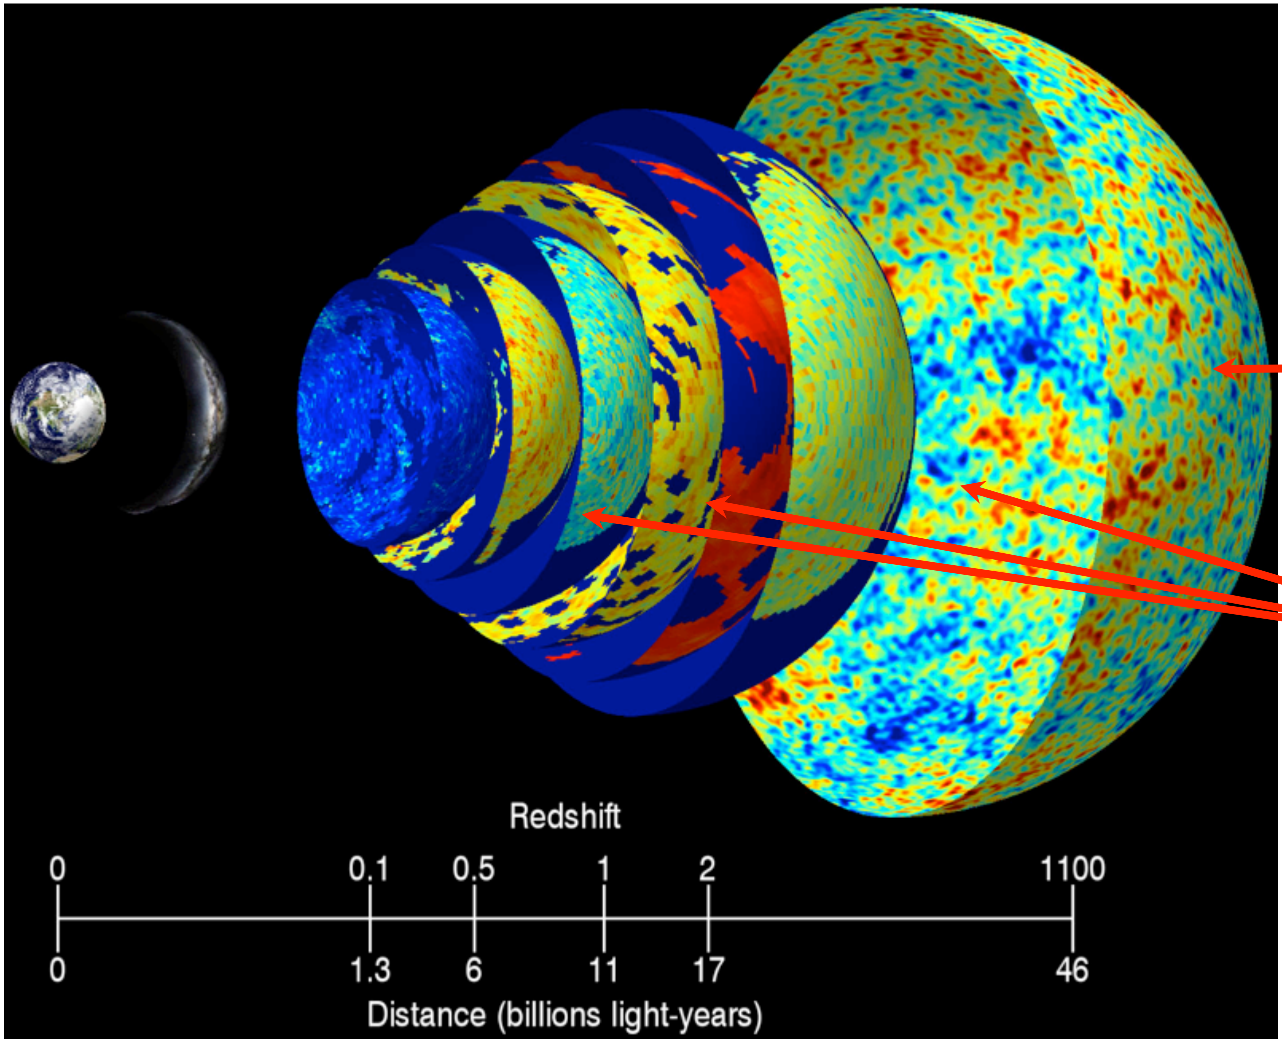
That pattern is preserved in the distribution of the galaxies.

By measuring the pattern looking back billions of years we can deduce the expansion history of the universe.



BAO at z=0.57
Anderson et al (2012)

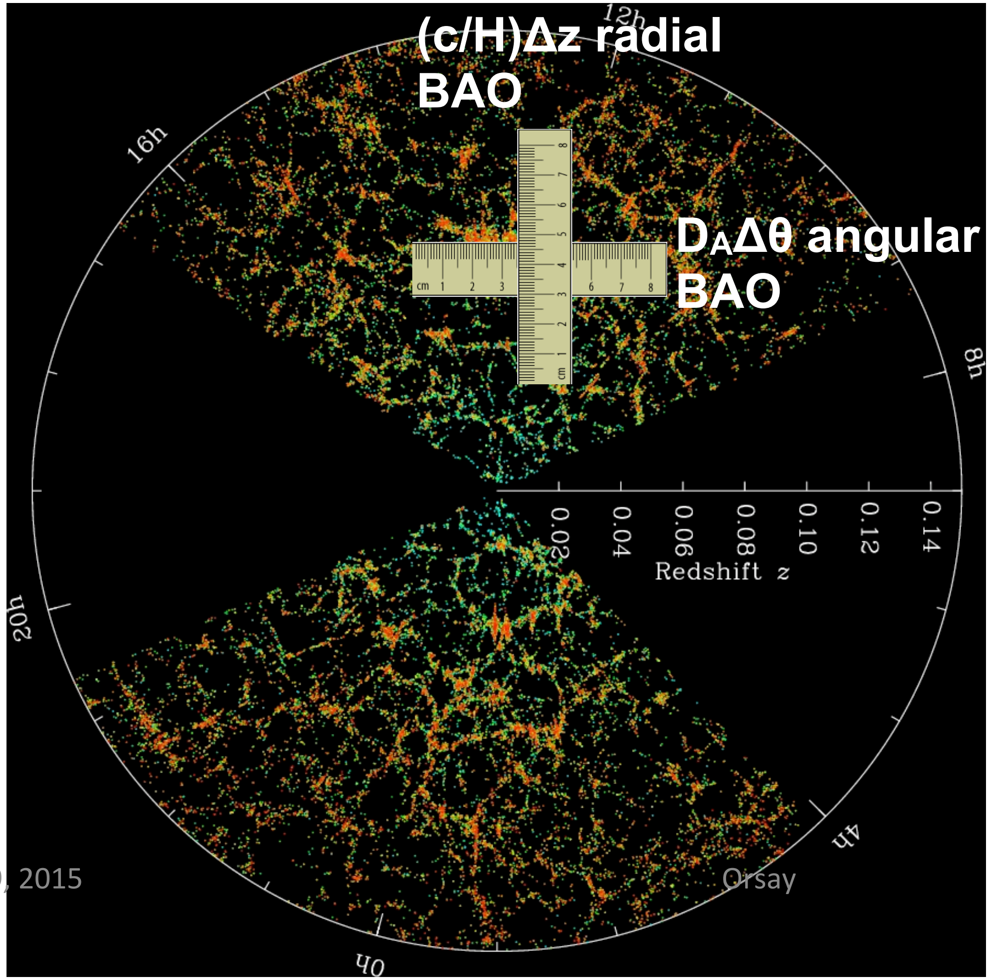
CMB is 2-d   BAO is 3-d

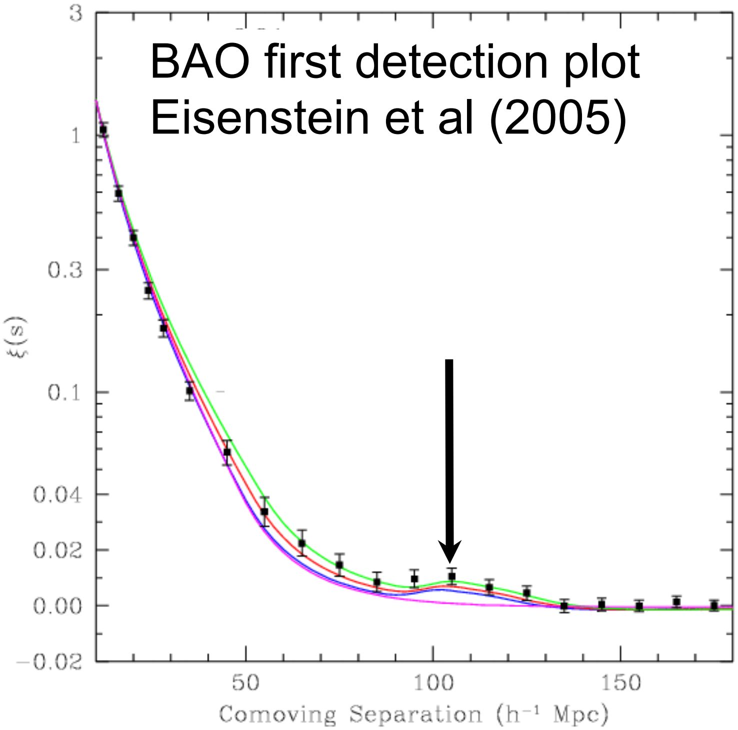


BAO standard ruler from Planck
$\theta_s = 0.596724 \pm 0.00038$ deg

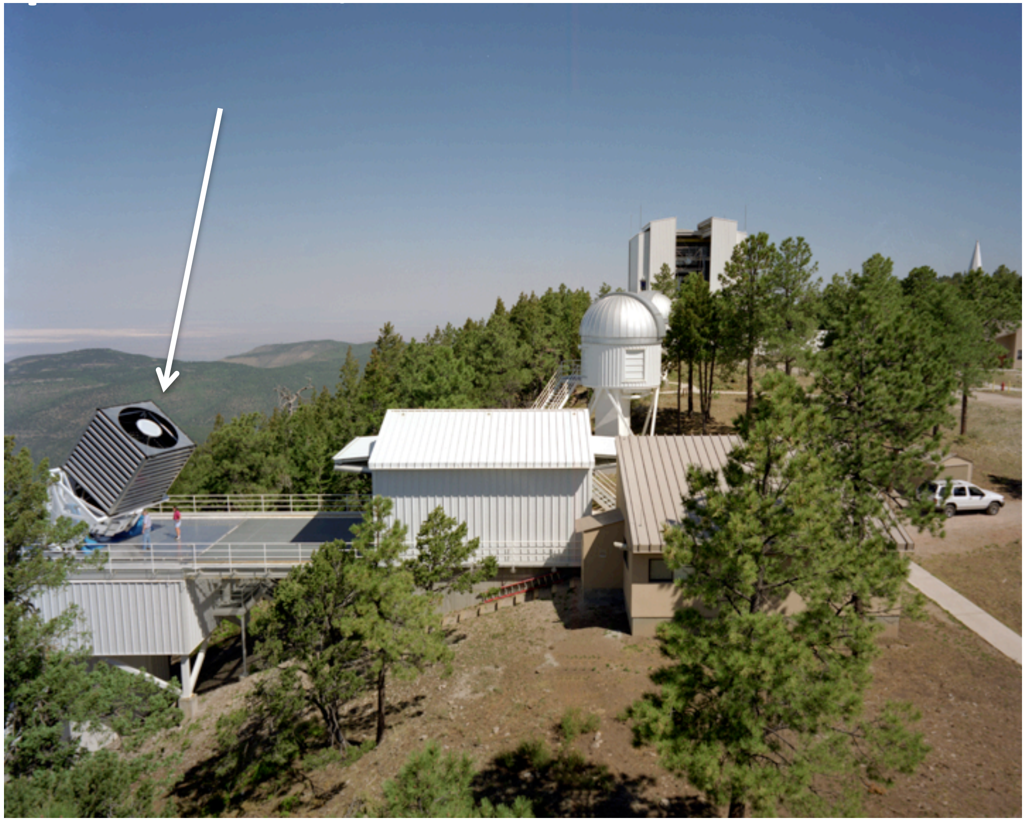
BAO standard ruler from BOSS & DESI

How BAO Works

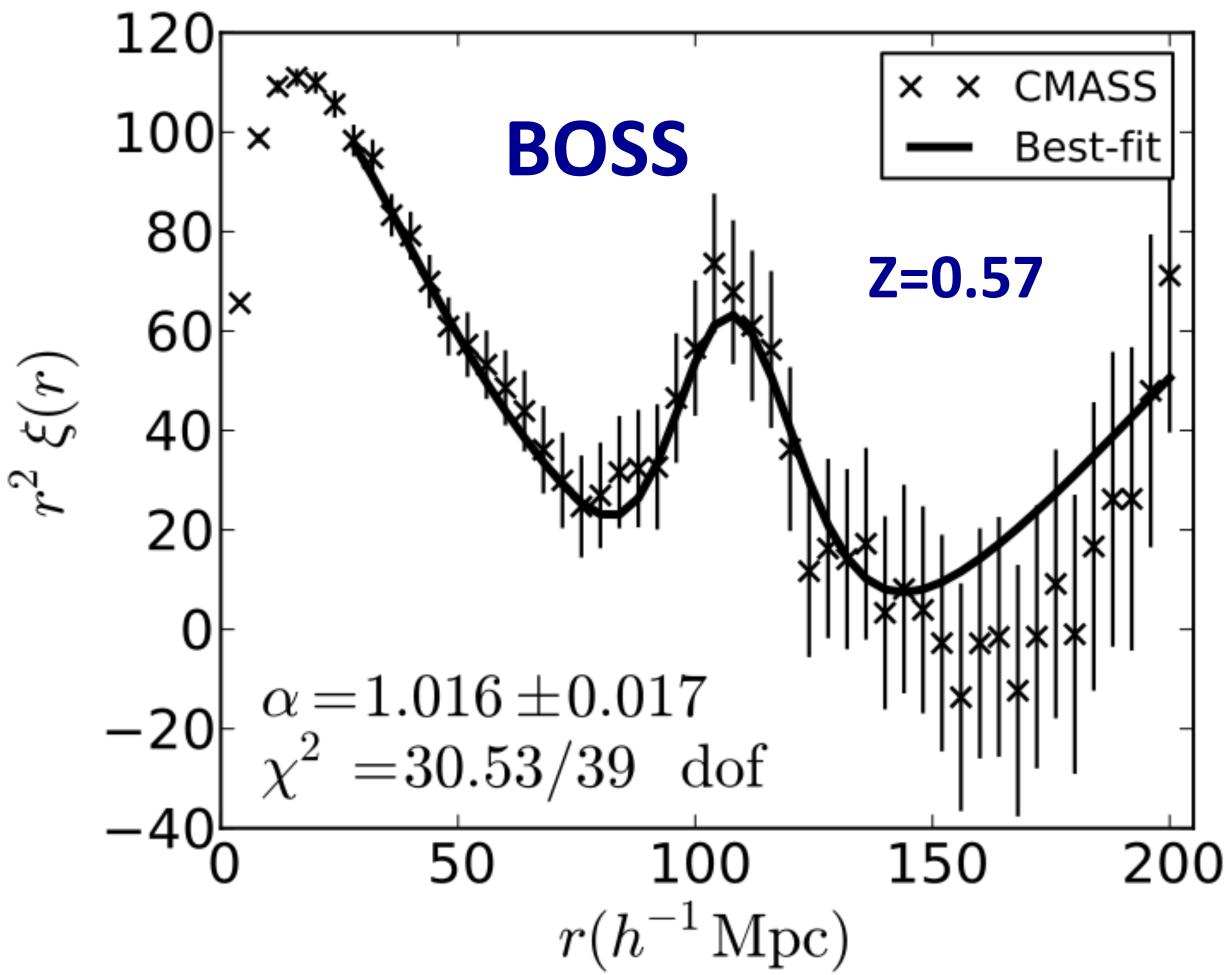




Best BAO so Far: BOSS
Now extended: eBOSS



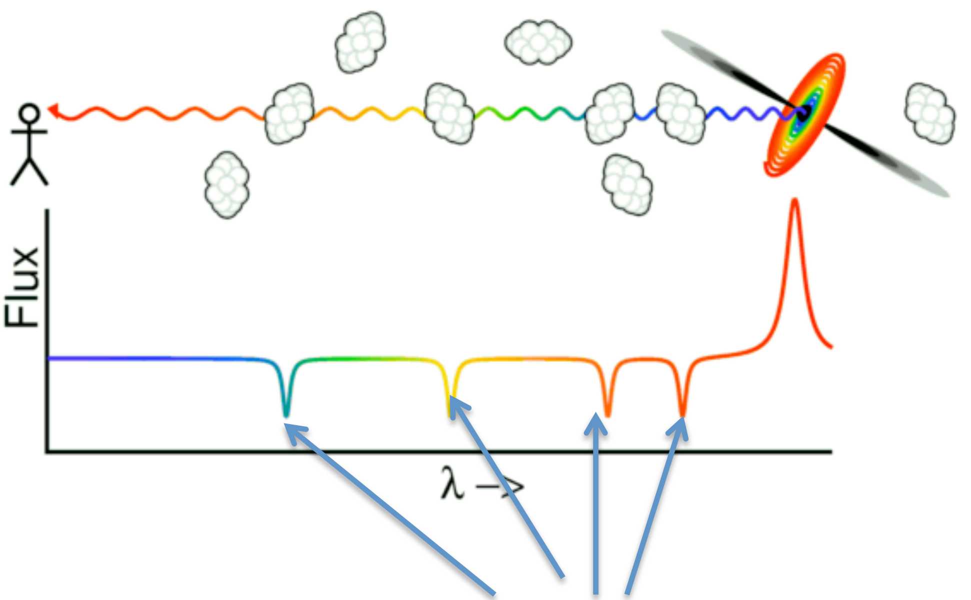
Measure Two-Point Galaxy-Galaxy Correlation



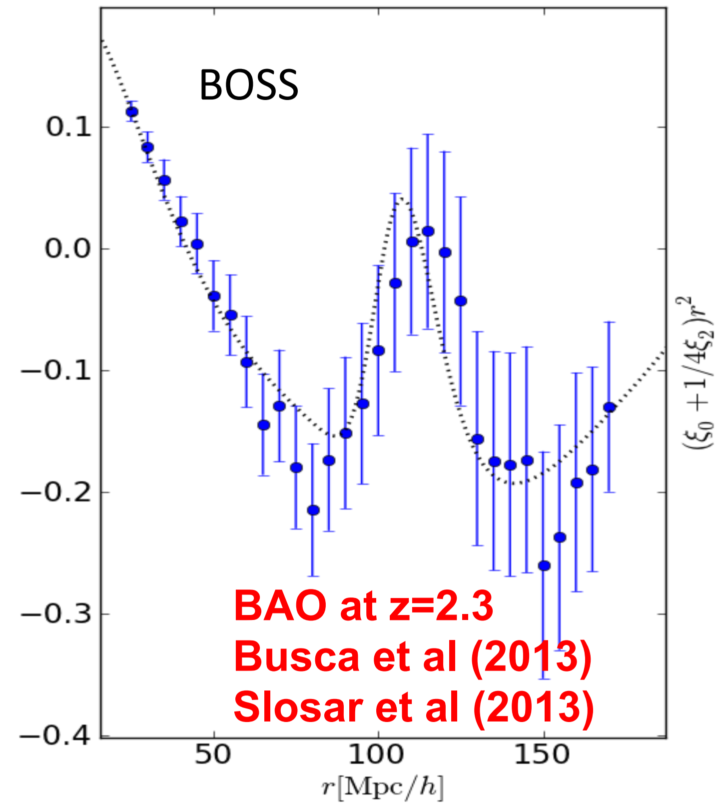
Anderson et al.
MNRAS 427, 3435A
(2012)

Lyman-alpha forest: First dark energy results z>2

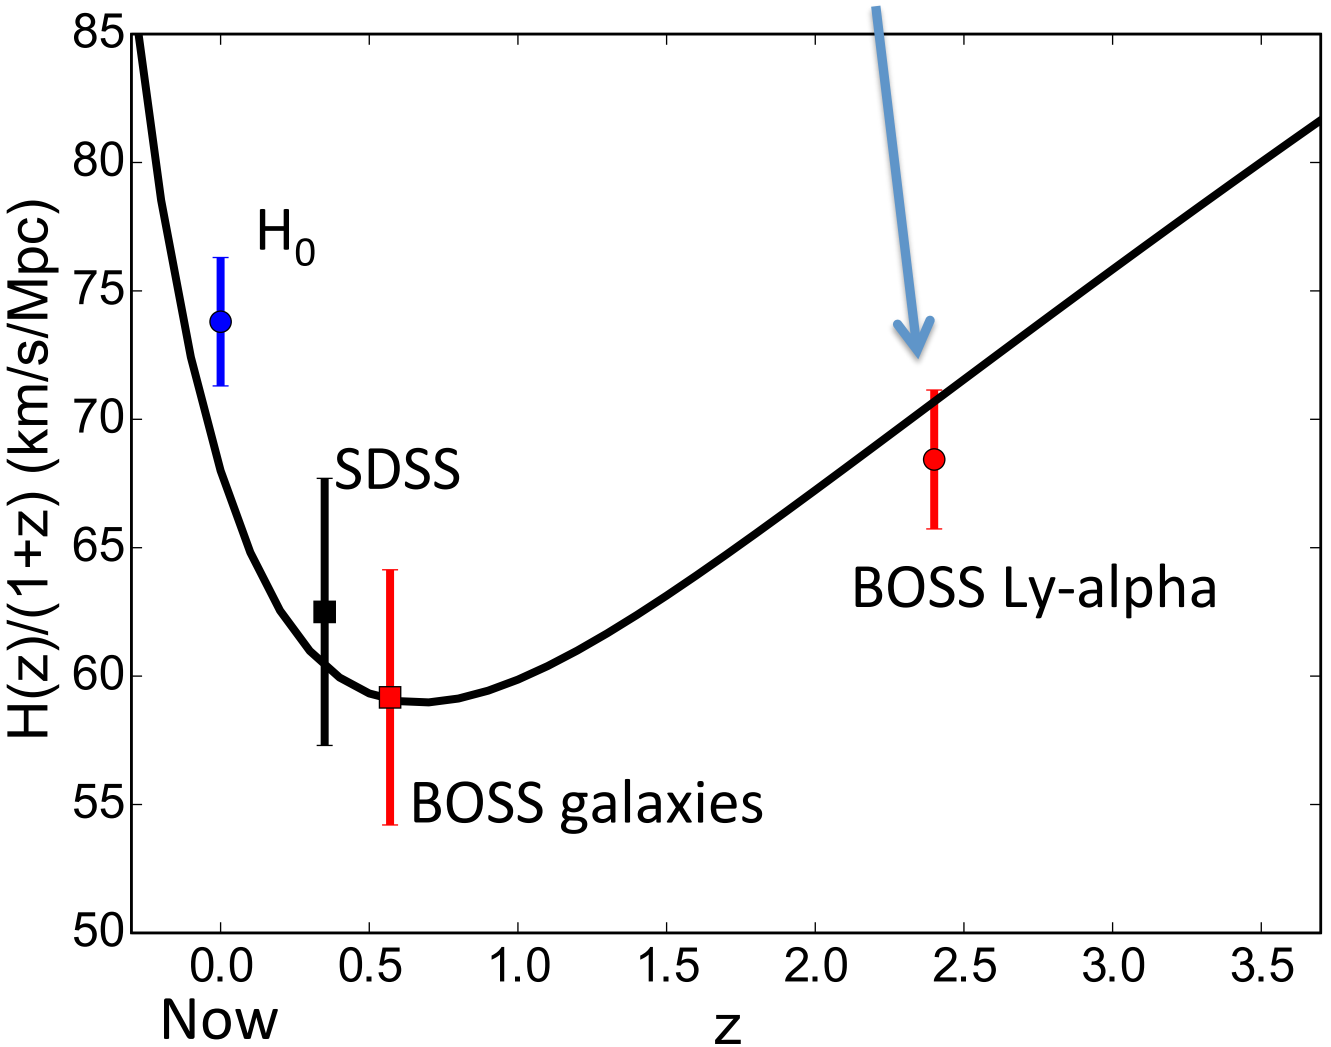
Forest of absorption lines maps location of neutral hydrogen along line-of-sight from quasar.



Light absorbed when stretched to 121.6 nm.



BOSS Lyman-alpha Sees Deceleration!



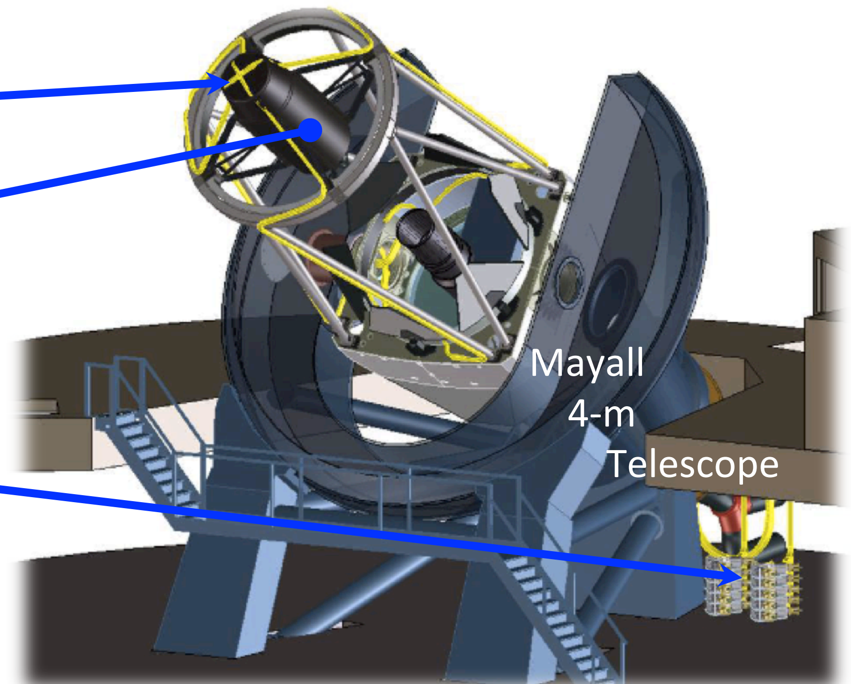
From BOSS to DESI

- Scale up BOSS to a massively parallel fiber-fed spectrometer
- Broad range of target classes: LRG's, ELG's, QSO's
- Broad redshift range: 0.5 < z < 1.6, 2.2 < z < 3.5 {region between 0.7 – 1.6 new}
- Sky area: 14,000 square degrees
- Number of redshifts: 24 million
- Medium resolution spectroscopy, R ~ 4000
- Spectroscopy from blue to NIR: 360 nm < z < 980 nm
- Automated fiber system, N_{fiber} ~ 5000
- Up to 5 year DE survey

5000 fiber actuators

New 8 sq. deg field-of-view corrector

New spectrographs



DESI Hardware & Software Elements

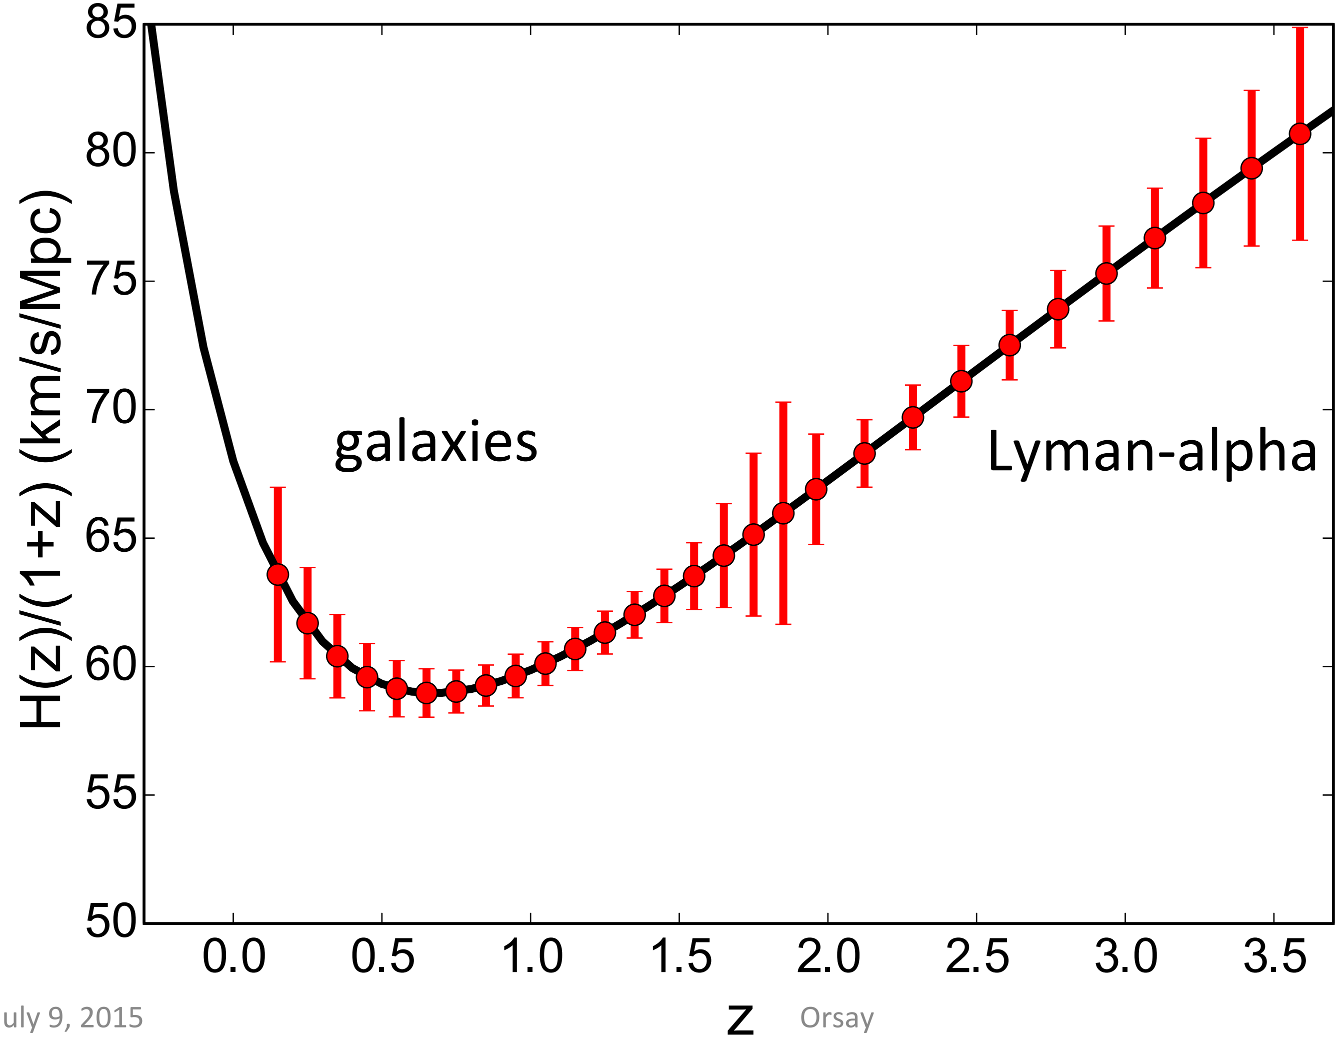
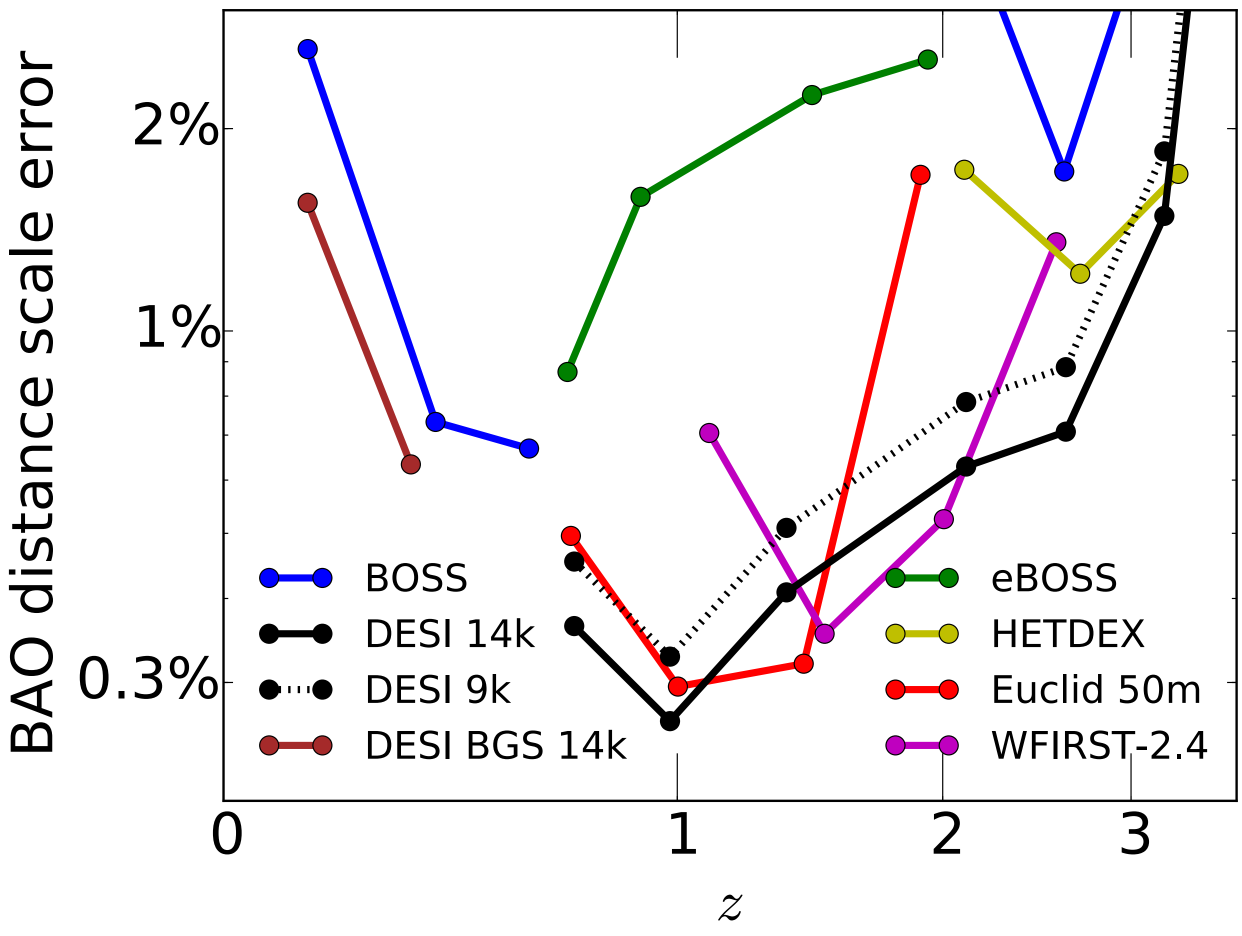
Anticipated Quality of DESI Expansion Measurements

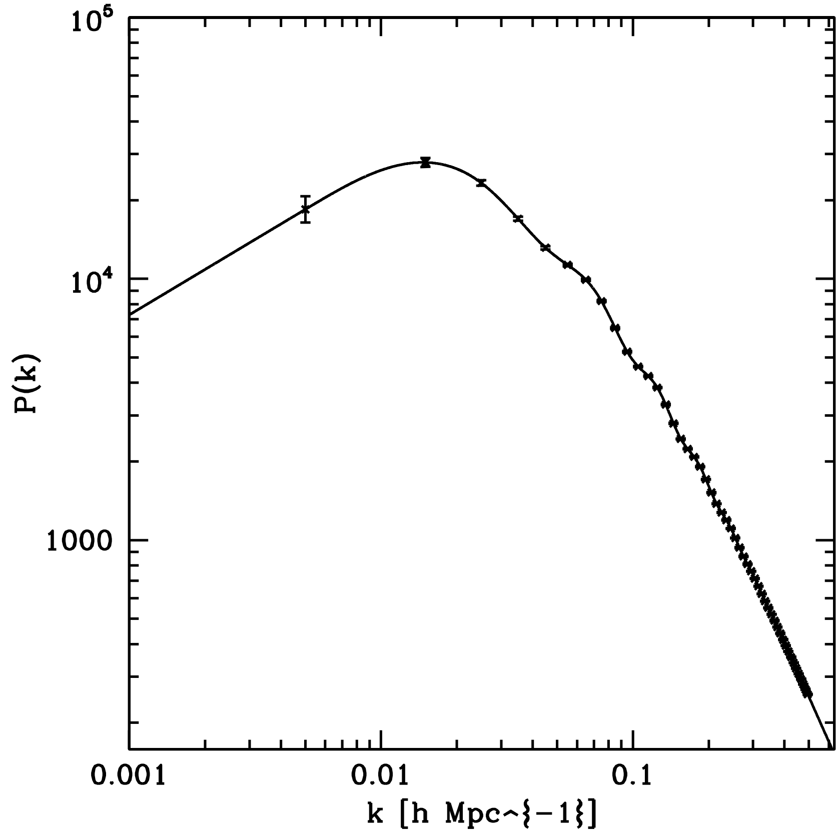


DESI Achieves Space-Based Precision



DESI: Not just BAO
Power Spectrum has More Info

Power spectrum is Fourier transform of two-point correlation function.



Power spectrum tests:

- General Relativity
- Inflation
- Number of neutrinos
- Sum of the neutrino masses

$n_s : \pm 0.0022$

$\alpha_s : \pm 0.0019$

$\Sigma m_\nu : \pm 0.021\text{eV}$

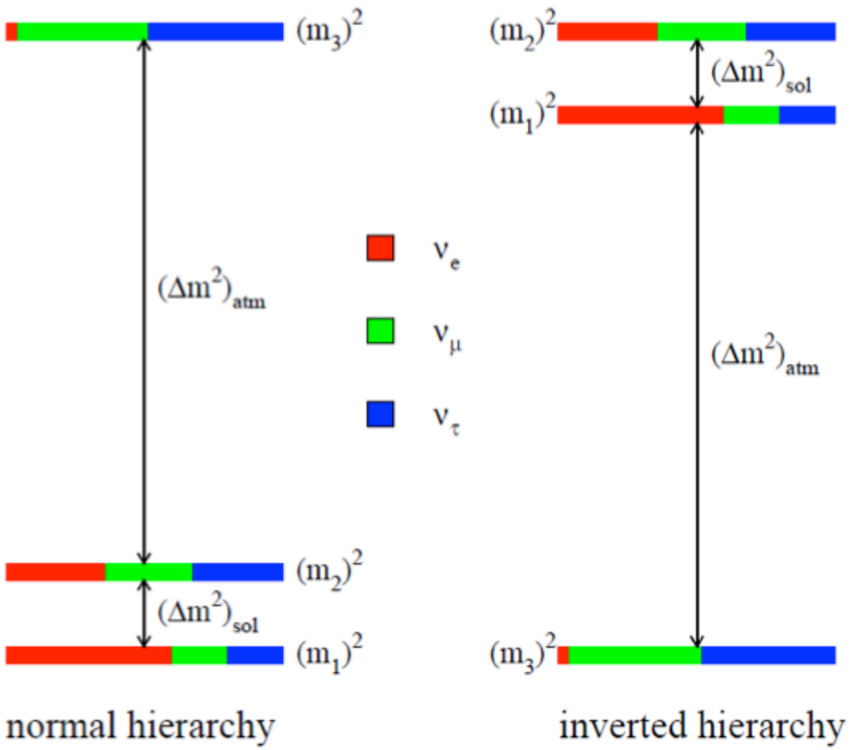
$\Sigma N_\nu : \pm 0.062$

Measuring the sum of neutrino masses

$$\Delta m^2_{32} = 2.32 \times 10^{-3}\,\mathrm{eV}^2$$

$$\Delta m^2_{21} = 7.50 \times 10^{-5}\,\mathrm{eV}^2$$

Data	$\sigma_{\Sigma m_\nu}$ [eV]	$\sigma_{N_{\nu,\mathrm{eff}}}$
Planck	0.350	0.18
Planck+DESI BAO	0.090	0.18
Gal ($k_{\max} = 0.1$)	0.024	0.13
Gal ($k_{\max} = 0.2$)	0.017	0.084
Ly-α forest	0.039	0.11
Ly-α forest + Gal ($k_{\max} = 0.2$)	0.017	0.063



Redshift Space Distortion

- Can't measure distance directly.
- Mismeasure if there is "peculiar velocity"

Assume $\vec{\mathrm{v}} = Hr\hat{n}$ along line of sight

so peculiar velocity $\Delta\vec{v}$ leads to shift

$\Delta r\,\hat{n} = \Delta\vec{\mathrm{v}}\cdot\hat{n}\;\hat{n}\,/\,H(a)$

- Gravity will amplify all density perturbations.

$$\delta\rho(t) = D(t)\,\delta\rho(t=0) \quad \text{[now]}$$

Galaxies vs Matter

- Assume fractional fluctuation in galaxy density is proportional to fractional fluctuation in matter:

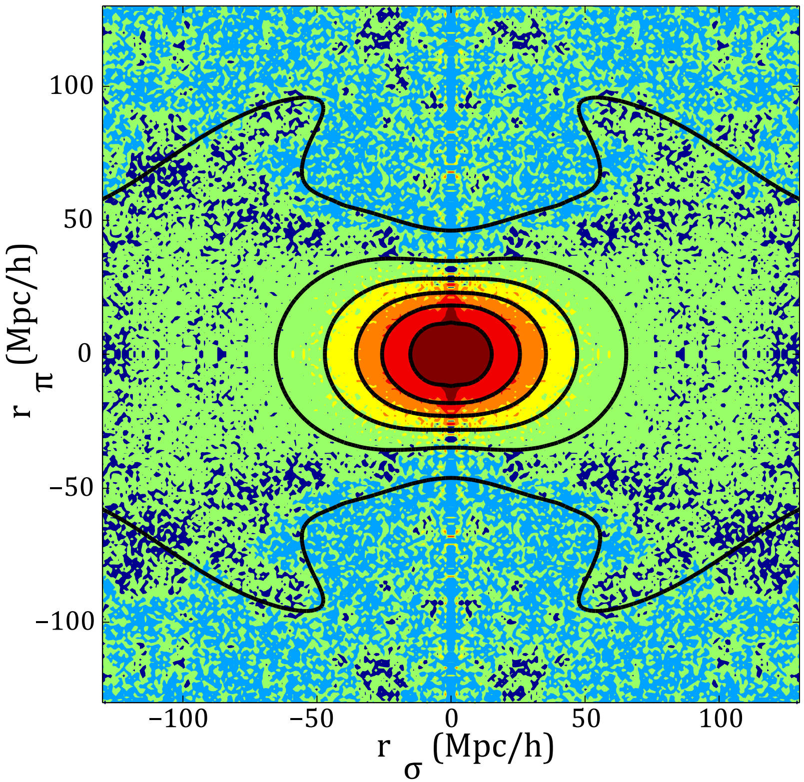
$$\delta_{galaxy} \equiv \frac{\delta\rho_{galaxy}}{\bar{\rho}_{galaxy}} = b\frac{\delta\rho_{matter}}{\bar{\rho}_{matter}} = b\delta_{matter}$$

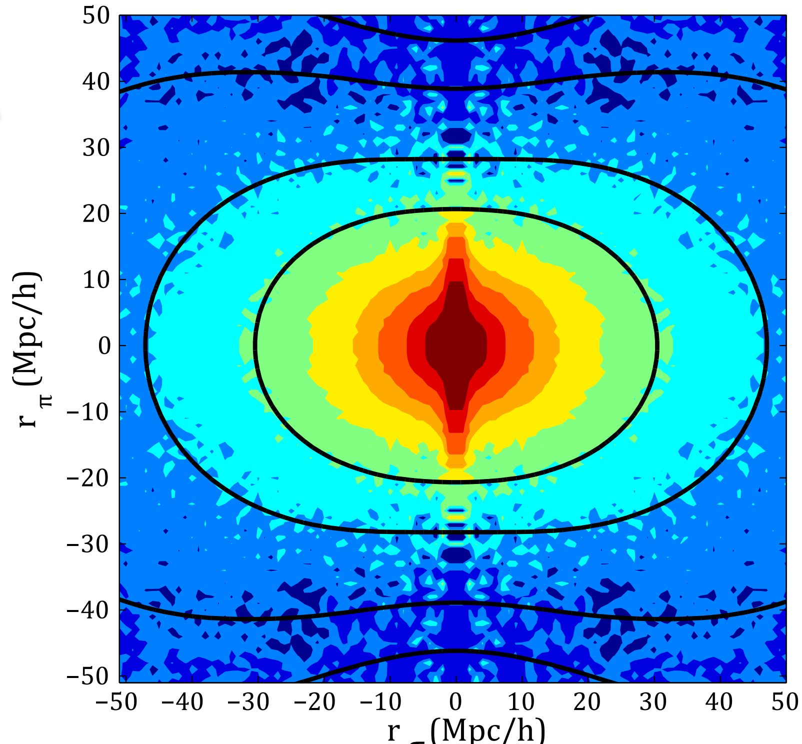
Because we observe in redshift space, there is a distortion of the power spectrum:

$$P(\vec{k})_{galaxy,RSD} = (b^2 + (\hat{k}\cdot\hat{n})^2 f)^2 P(k)_{matter,realspace}$$

$$f = \frac{d\ln D}{d\ln a}$$

Redshift Space Distortion at BOSS



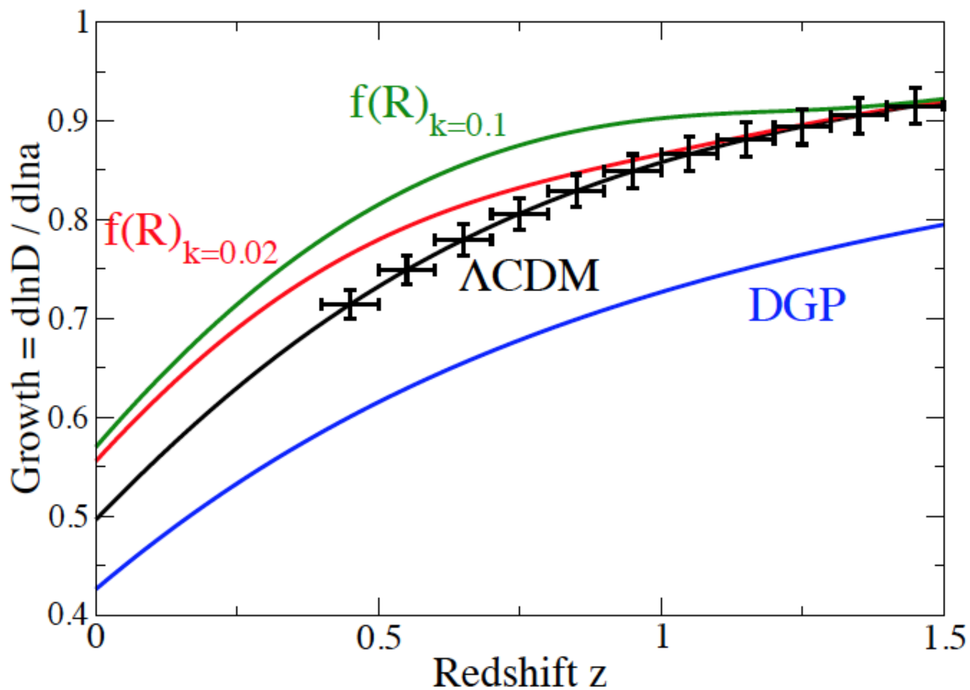


Line of sight

Testing General Relativity

- The growth function D(a) is determined by the matter density and General Relativity.

In practice, we measure $f\sigma_8$, where σ_8 sets the scale for P(k).
There will be 2% measurements of $f\sigma_8$ at many values of z.



Inflation

- Look at power spectrum

$$P(k) = P(k_0)(k/k_0)^{n_S(k_0) + \frac{1}{2}\alpha_S \ln(k/k_0)}$$

Planck:
n_S=0.9614 ±0.0063
a_S=-0.015±0.017

Data	σ_{n_s}	σ_{α_s}
Gal ($k_{max} = 0.1$ h^{-1}Mpc)	0.0024 (1.6)	0.0051 (1.1)
Gal ($k_{max} = 0.2$ h^{-1}Mpc)	0.0022 (1.7)	0.0040 (1.3)
Ly-α forest	0.0029 (1.3)	0.0027 (2.0)
Ly-α forest + Gal ($k_{max} = 0.2$)	0.0019 (2.0)	0.0020 (2.7)

Non-Gaussianity

Primoridal fluctuations: $\Phi = \phi_G + f_{NL}(\phi_G^2 - <\phi_G^2>)$

$$f_{NL}(k) = f_{NL}^*(k/k^*)^{n_{fNL}}$$
