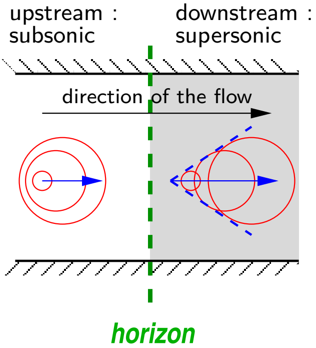
Analogous black-holes in Bose-Einstein condensates

How to create them and how to detect the associated (sonic) Hawking radiation ?

Nicolas Pavloff LPTMS, Université Paris-Saclay

École de Gif, LAL, october 2017



upstream :
subsonic

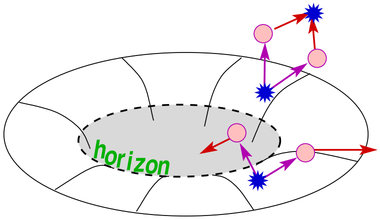
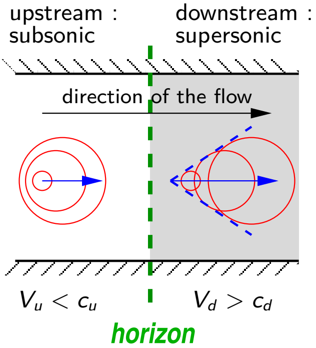
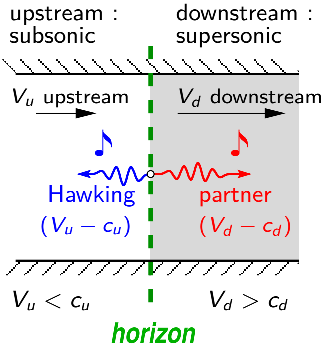
gravitational black hole

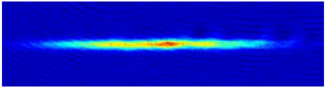


Hawking radiation 75'

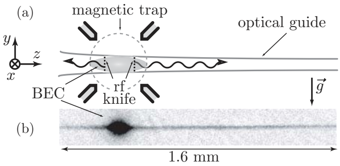
Analogous Hawking radiation





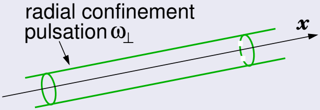


quasi-1D condensate
longitudinal size $\sim 10^2 \mu$m
transverse size $\sim 1\mu$m



Guerin *et al.*, Phys. Rev. Lett. (2006)

tight harmonic radial confinement :



$$V_\perp(\vec{r}_\perp) = \frac{1}{2} m \omega_\perp^2 r_\perp^2 .$$

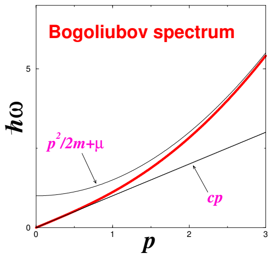
$\rightarrow$ **1D model** : $\Psi(x,t)$

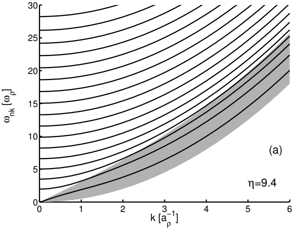
domain of validity

$$\frac{\hbar\,\omega_\perp}{\hbar^2/ma^2} \ll n_1 a \sim \frac{\mu}{\hbar\omega_\perp} \ll 1 \qquad \left\{ \begin{array}{l} a \;= 3D \text{ scattering length} \\ n_1 = 1D \text{ linear density} \end{array} \right.$$

• The first inequality allows to avoid the Tonks-Girardeau regime and implies $E_{\rm int} \ll E_{\rm kin}$. Also $L_\phi \ggg \xi$ $\qquad L_\phi = \xi \exp\left[\pi\sqrt{\frac{\hbar\, n_1}{2m\, a\, \omega_\perp}}\right]$

• the second inequality allows to avoid the 3D-like transverse Thomas-Fermi regime and implies that transverse motion is "frozen" (more precisely: Born-Oppenheimer approximation)

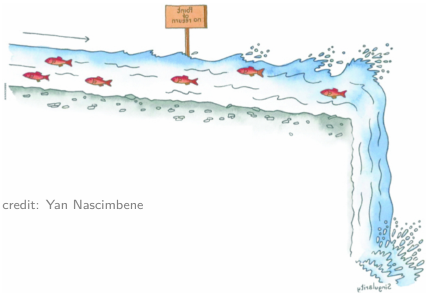




C. Tozzo & F. Dalfovo, PRA (2002)

$\leftarrow \eta = \frac{\mu}{\hbar\omega_\perp} = 9.4$
only axi-symmetric excitations included ($m = 0$)

A possible dumb hole configuration



credit: Yan Nascimbene

stationary: $\Psi(x,t) = \psi(x)\exp\{-i\mu t\}$

classical mean field:

$$-\frac{1}{2}\psi_{xx} + \left(U(x) + g|\psi|^2\right)\psi = \mu\,\psi$$

where[a] $g = 2\omega_{\perp} a$

$n(x) = |\psi|^2$ $\qquad$ $n(x)v(x) = Im(\psi^* \cdot \psi_x)$

[a] Olshanii, PRL (1998)

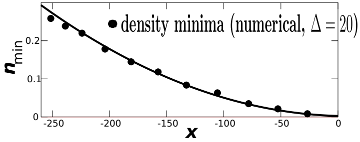
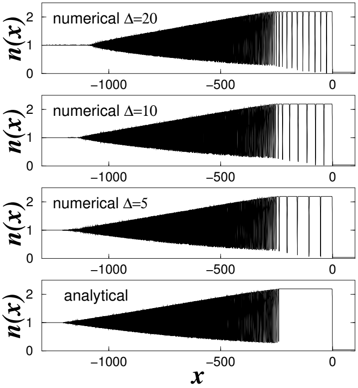
black=Whitham+transonic



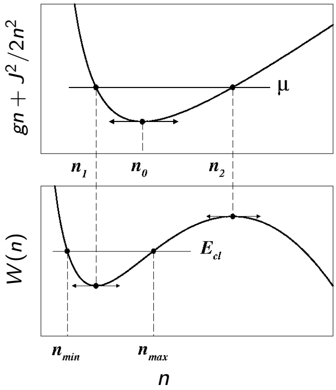


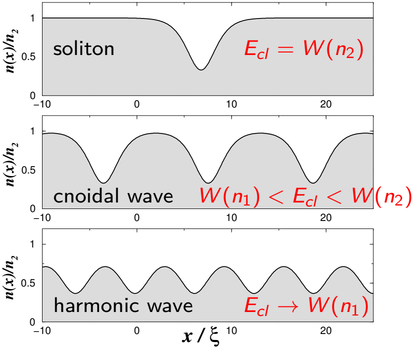
Soliton train in the upstream plateau... experimental problem ?

$$-\tfrac{1}{2}A_{xx} + \left[g\, n + \frac{J^2}{2n^2} - \mu\right] A = 0\,, \quad \text{where} \quad J = n(x)v(x) \quad \text{and} \quad A = \sqrt{n}$$

first integral:

$$\tfrac{1}{2}A_x^2 + W(n) = E_{cl}\,, \quad \text{where} \quad W(n) = -\frac{g}{2}n^2 + \mu n + \frac{J^2}{2n}\,.$$



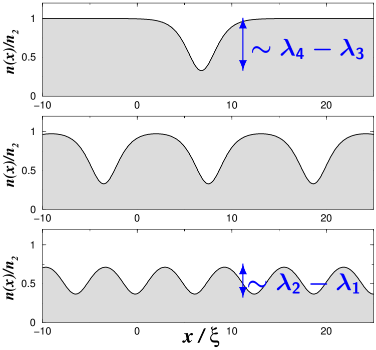


Stationary solutions of the NLS equation

$$n(x,t) = \tfrac{1}{4}(\lambda_4 - \lambda_3 - \lambda_2 + \lambda_1)^2 + (\lambda_4 - \lambda_3)(\lambda_2 - \lambda_1)\mathrm{sn}^2\left(k\,(x - Vt), m\right)\ ,$$

$$k = \sqrt{(\lambda_4 - \lambda_2)(\lambda_3 - \lambda_1)}, \quad V = \tfrac{1}{4}(\lambda_1 + \lambda_2 + \lambda_3 + \lambda_4), \quad m = m\{\lambda_i\} \in [0,1],$$

$$v(x,t) = V - \tfrac{C\{\lambda_i\}}{n(x,t)}.$$



soliton limit: $\lambda_2 \to \lambda_3$

cnoidal wave: $\lambda_1 < \lambda_2 < \lambda_3 < \lambda_4$

KdV 1895 We propose to attach to this type of wave the name of *cnoidal* waves (in analogy with sinusoidal waves). For $k=0$

sinusoidal limit: $\lambda_2 \to \lambda_1$

Forest & Lee (1986), Pavlov (1987)

slow modulations $\lambda_i \to \lambda_i(x,t)$ with

$$\frac{\partial \lambda_i}{\partial t} + \mathscr{V}_i(\{\lambda_j\}) \frac{\partial \lambda_i}{\partial x} = 0$$

$$\mathscr{V}_1(\{\lambda_j\}) = \frac{1}{2}\sum_{i=1}^4 \lambda_i - \frac{(\lambda_4-\lambda_1)(\lambda_3-\lambda_1)K(m)}{(\lambda_4-\lambda_1)K(m)-(\lambda_3-\lambda_1)E(m)} \qquad m = \frac{(\lambda_2-\lambda_1)(\lambda_4-\lambda_3)}{(\lambda_4-\lambda_2)(\lambda_3-\lambda_1)}$$

Gurevich-Pitaevskii problem

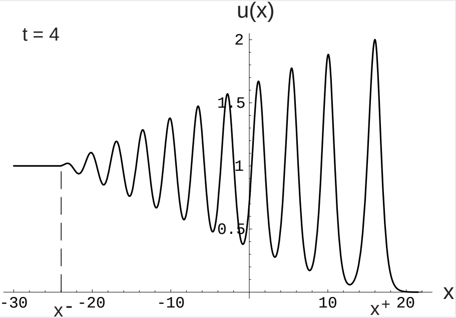
Gurevich & Pitaevskii (1973)

simple case: decay of a initial discontinuity $\to$ dispersive shock wave

no characteristic length : self-similar solution depending on $\zeta = x/t$ and matching to the right and left boundaries with a non dispersive flow.

$$u_t + u u_x + u_{xxx} = 0$$

$$u(x, t=0) = \begin{cases} 1 \text{ if } x < 0\,, \\ 0 \text{ if } x > 0\,. \end{cases}$$



Whitham modulation equations

Forest & Lee (1986), Pavlov (1987)

slow modulations $\lambda_i \to \lambda_i(x,t)$ with

$$\frac{\partial \lambda_i}{\partial t} + \mathscr{V}_i(\{\lambda_j\})\,\frac{\partial \lambda_i}{\partial x} = 0$$

$$\mathscr{V}_1(\{\lambda_j\}) = \tfrac{1}{2}\sum_{i=1}^{4}\lambda_i - \frac{(\lambda_4-\lambda_1)(\lambda_3-\lambda_1)K(m)}{(\lambda_4-\lambda_1)K(m)-(\lambda_3-\lambda_1)E(m)} \qquad m = \frac{(\lambda_2-\lambda_1)(\lambda_4-\lambda_3)}{(\lambda_4-\lambda_2)(\lambda_3-\lambda_1)}$$

Gurevich-Pitaevskii problem

Gurevich & Pitaevskii (1973)

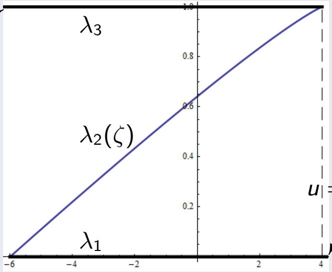
simple case: decay of a initial discontinuity $\to$ dispersive shock wave

no characteristic length : self-similar solution depending on $\zeta = x/t$ and matching to the right and left boundaries with a non dispersive flow.

$u = \lambda_3 = 1$

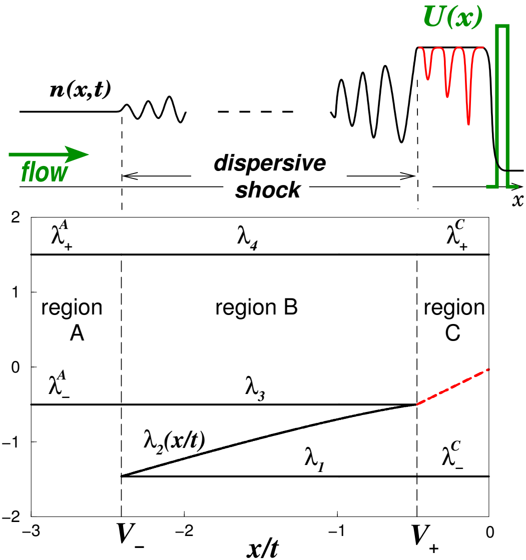
$$(\mathscr{V}_i - \zeta)\,\frac{\mathrm{d}\lambda_i}{\mathrm{d}\zeta} = 0$$

$$u(x,t=0) = \begin{cases} 1 \text{ if } x < 0\,, \\ 0 \text{ if } x > 0\,. \end{cases}$$



$u = \lambda_1 = 0$

x^- x^+

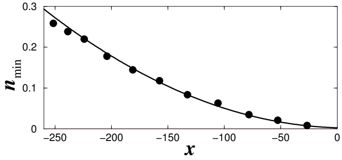


soliton train:

★ λ_1, λ_4: fixed
$\lambda_2(\frac{x}{t}) = \lambda_3(\frac{x}{t})$

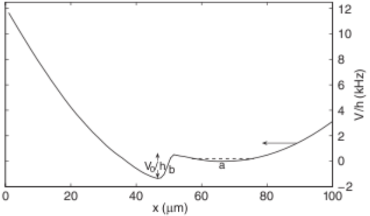
★ $\frac{x}{t} = \frac{1}{2}\sum_{i=1}^{4} \lambda_i$
yields $\rightarrow \lambda_{2,3}\left(\frac{x}{t}\right)$

★ $n_{\min} = f(\lambda_i\text{'s})$
$= f(\frac{x}{t})$



Technion experiment

Lahav *et al.* PRL (2010)



The arrow indicates the direction of the harmonic potential relative to the stationary step like potential ($v \sim 0.3$ mm/s).

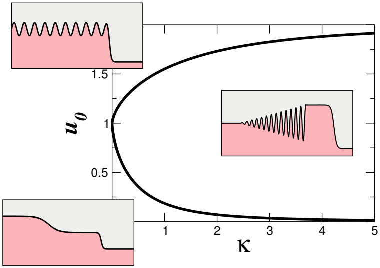
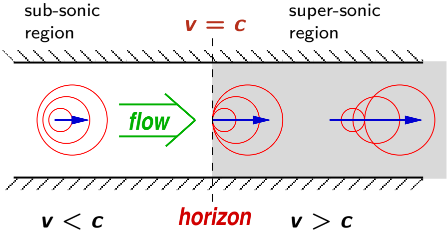
Beware of fluctuations !

cf. case of δ-peak configuration:

$U(x) = \kappa\,\delta(x)$

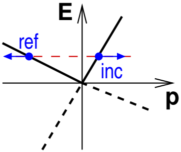




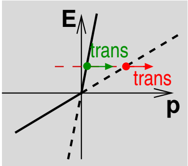
stimulated Hawking radiation:

in the laboratory :

$$E(p) = \underbrace{c\,|p|}_{\text{comoving}} + \underbrace{v\,p}_{\text{Doppler}}$$

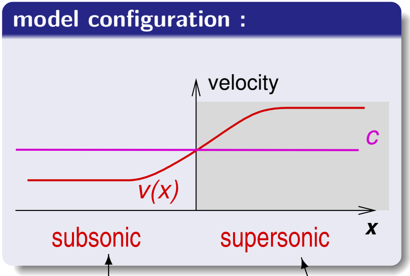


subsonic region

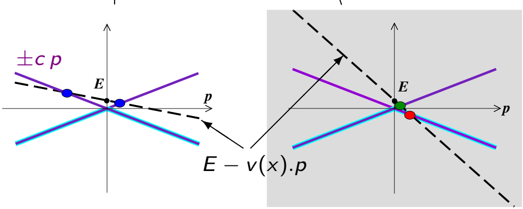


supersonic region

the position of the horizon is energy-dependent



$$E - v(x).p = \pm\, c\, p$$



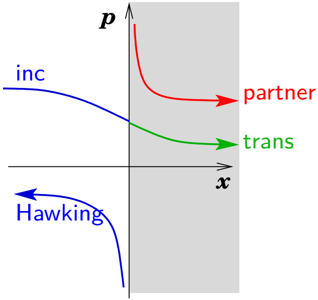
$v(x) < c$

region $x < 0$

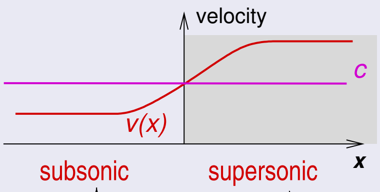
$v(x) > c$

region $x > 0$

phase space :



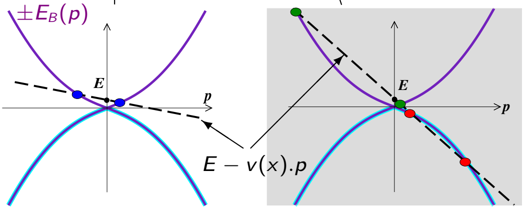
model configuration :



$$E - v(x).p = \pm\, E_B(p)$$

with

$$E_B(p) = c\, p\, \sqrt{1 + \xi^2 p^2/4}$$



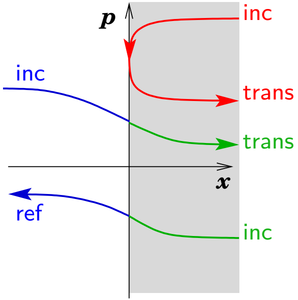
$v(x) < c$

region $x < 0$

$v(x) > c$

region $x > 0$

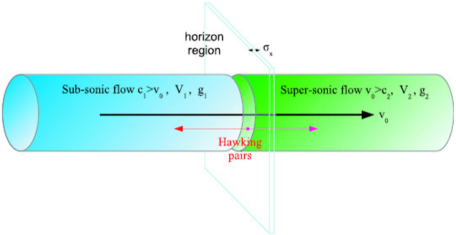
phase space :

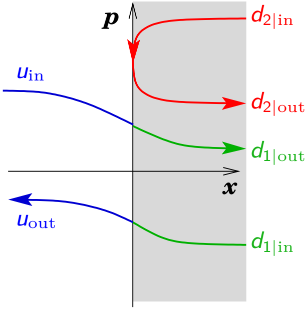


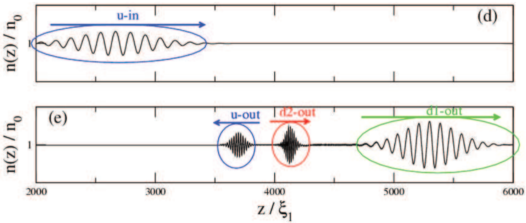
$U(x)$ and $g(x)$ **step like** with
$U(x) + g(x) n_0 = C^{\rm st}$ such that
$\psi_0(x) = \sqrt{n_0}\, \exp\{i k_0\, x\}$, verifies $\forall x$

$$-\tfrac{1}{2}\psi_0'' + \left[U(x) + g(x)|\psi_0|^2\right] \psi_0 = \mu\, \psi_0 \ ,$$

$$C^{\rm st} = \mu - \frac{k_0^2}{2} \ .$$







Up to now, only classical description (= wave mechanics).

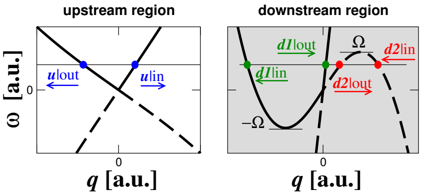
Realistic “dumb hole” configuration: i.e., formation of a sonic event horizon

“δ-peak “: dynamical process well described by Whitham approach

“waterfall” configuration: co-validated by experiment

“stimulated Hawking radiation”: quantum reflection + mode conversion

$$\omega - Vq = \pm E_B(q)$$



linear relation connecting the out-going modes to the in-going ones

$$\begin{pmatrix} u|\mathrm{out} \\ d_1|\mathrm{out} \\ (d_2|\mathrm{out})^\dagger \end{pmatrix} = \mathbf{S}(\omega) \begin{pmatrix} u|\mathrm{in} \\ d_1|\mathrm{in} \\ (d_2|\mathrm{in})^\dagger \end{pmatrix}$$

$$\langle u^\dagger_{\mathrm{out}}\, u_{\mathrm{out}}\rangle = |\mathbf{S}_{uu}|^2 \langle u^\dagger_{\mathrm{in}} u_{\mathrm{in}}\rangle + |\mathbf{S}_{ud_1}|^2 \langle d^\dagger_{1\mathrm{in}}\, d_{1\mathrm{in}}\rangle + |\mathbf{S}_{ud_2}|^2 \langle d_{2\mathrm{in}}\, d^\dagger_{2\mathrm{in}}\rangle$$

at $T = 0$: $\langle u^\dagger_{\mathrm{out}}\, u_{\mathrm{out}}\rangle = |\mathbf{S}_{ud_2}(\omega)|^2$ needs $\left\{ \begin{array}{l} u \rightleftharpoons d_2 \text{ mode conversion} \\ d_2\text{-ingoing mode} \end{array} \right.$

Spontaneous Hawking radiation

$$\mathrm{i}\,\partial_t \hat{\Psi} = -\tfrac{1}{2}\partial_x^2 \hat{\Psi} + \left[U(x) + g\,\hat{\Psi}^\dagger \hat{\Psi}\right]\hat{\Psi}$$

Energy current associated to emission of elementary excitations

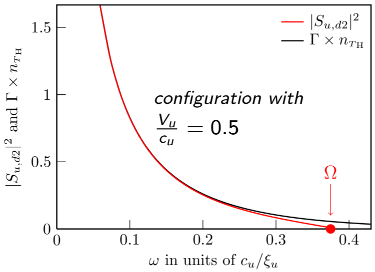
$$\hat{\Pi} = -\tfrac{1}{2}\partial_t \hat{\Psi}^\dagger \partial_x \hat{\Psi} + \mathrm{h.c.}$$

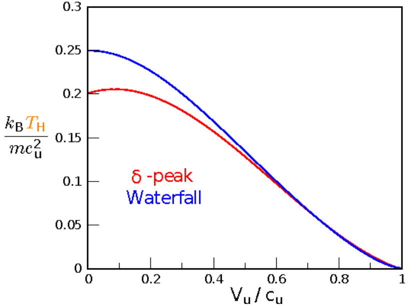
at $T = 0$, $\langle \hat{\Pi} \rangle = -\int_0^\infty \frac{\mathrm{d}\omega}{2\pi}\, \hbar\omega\, |S_{u,d2}|^2$

Hawking radiation in the $u|\mathrm{out}$ channel. Equivalent to a black body radiation of temperature $T_H \sim 10\%\ \mu$

$$|S_{u,d2}|^2 \overset{\omega\to 0}{\sim} \frac{\Gamma}{\exp\{\hbar\omega/k_B T_H\} - 1}$$

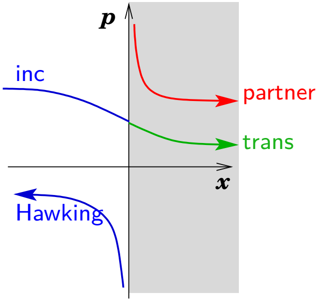
$$\to \frac{k_B T_H}{g n_u} \sim 0.1 \to T_H \sim 5 - 10\ \mathrm{nK}$$





long wave length limit : $E - v(x) \cdot p = \pm c(x) \cdot p \quad \rightarrow \quad p = \dfrac{E}{v(x) \pm c(x)}$

phase space :



Tunnel probability

$P \propto e^{-2S/\hbar}$ where $S = \left| Im \int p(x)\, dx \right|$

near the horizon

$$\frac{E}{v(x)-c(x)} \simeq \frac{E}{(x \pm i\epsilon)\, \frac{d}{dx}(v-c)\big|_0} \rightarrow \pm i\delta(x) \frac{E}{\frac{d}{dx}(v-c)\big|_0}$$

$$S \simeq \frac{\pi\, E}{\frac{d}{dx}(v-c)\big|_0}$$

Hawking temperature

$P \propto e^{-E/(k_B T_H)}$ with $k_B T_H = \dfrac{\hbar}{2\pi} \left| \dfrac{d}{dx}(v-c) \right|_0$

linear relation connecting the out-going modes to the in-going ones

$$\begin{pmatrix} u|\mathrm{out} \\ d_1|\mathrm{out} \\ (d_2|\mathrm{out})^\dagger \end{pmatrix} = \mathbf{S}(\omega) \begin{pmatrix} u|\mathrm{in} \\ d_1|\mathrm{in} \\ (d_2|\mathrm{in})^\dagger \end{pmatrix}$$

at $T = 0$ outgoing energy current

$$\langle \hat{\Pi} \rangle = -\int_0^\infty \frac{\mathrm{d}\omega}{2\pi}\, \hbar\omega\, |S_{u,d2}|^2$$

$$S_{u,d2} = \frac{f_{u,d2}}{\sqrt{\omega/gn_u}} + h_{u,d2}\sqrt{\omega/gn_u} + \mathcal{O}(\omega^{3/2})$$

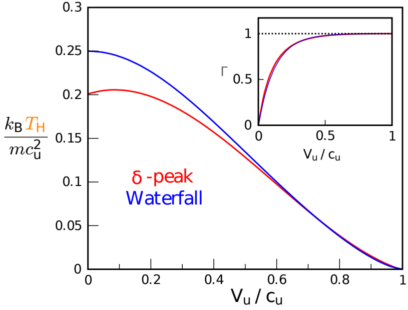
$$|S_{u,d2}|^2 = \Gamma(\omega) n_{therm}(\omega)$$

$$= (\Gamma + \mathcal{O}(\omega^2))(\frac{k_B T_H}{\omega} + \frac{1}{2} + \mathcal{O}(\omega))$$

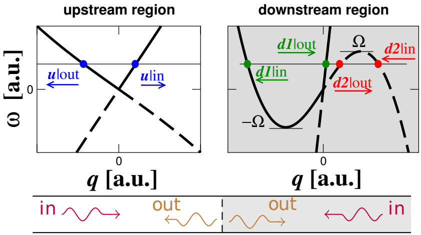
in the waterfall configuration

$$\frac{k_B T_H}{gn_u} = \frac{1}{2}\frac{(1-M_u^4)^{3/2}}{(2+M_u^2)(1+2M_u^2)}$$

where $M_u = V_u/c_u$



Balbinot, Carusotto, Fabbri, Fagnocchi, Recati, Phys. Rev. A & New J. Phys. (2008)



★ example of induced correlation:

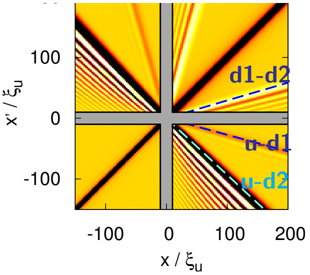
$x = (v_d + c_d)t$ correlates with $x' = (v_u - c_u)t$

★ affects the density correlation pattern

New theoretical and experimental interest:

study of density correlation on each side of the horizon

$$g^{(2)}(x,x') = \frac{\langle : n(x) n(x') : \rangle}{\langle n(x') \rangle \langle n(x) \rangle} - 1$$

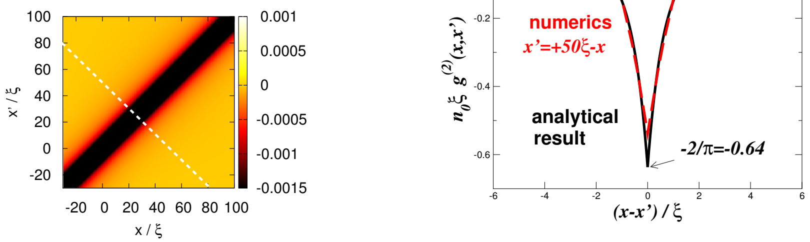


Larré *et al.*, Phys. Rev. A (2012)

Uniform 1D Condensate (no black hole)

$$g^{(2)}(x,x') = \frac{1}{n_0\,\xi}\,F\left(\frac{|x-x'|}{\xi}\right) \qquad \text{where} \qquad \begin{cases} F(X) = -\dfrac{1}{\pi X}\displaystyle\int_0^\infty \mathrm{d}t\,\dfrac{\sin(2tX)}{(1+t^2)^{3/2}} \\ F(0) = -2/\pi\ . \end{cases}$$

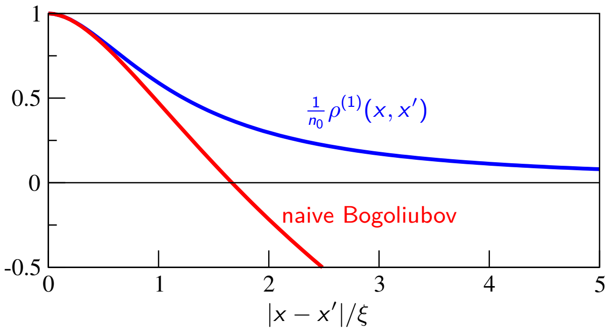
$$\left(\mu = g\,n_0 = \frac{1}{\xi^2}\right)$$



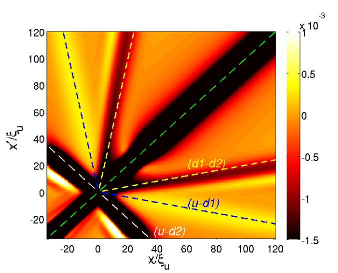
Popov result ($T = 0$)

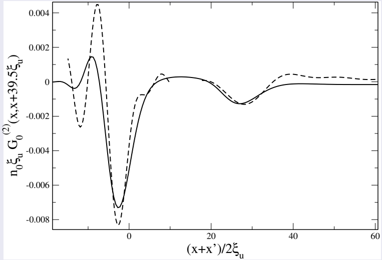
$$\frac{1}{n_0}\rho^{(1)}(x,x') = exp\left\{-\frac{F\left(|x-x'|/\xi\right)}{2\pi n_0 \xi}\right\} \qquad \text{where}$$

$$F(X) = \int_0^\infty \mathrm{d}t\,\left(\frac{t^2+2}{t\sqrt{t^2+4}}-1\right)\left(1-\cos(X\,t)\right)$$



Comparison of numerical and analytic results (model configuration)

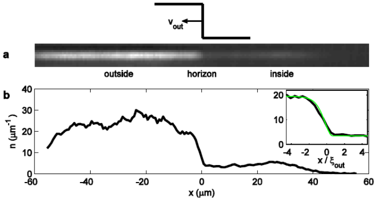




main correlation signal :

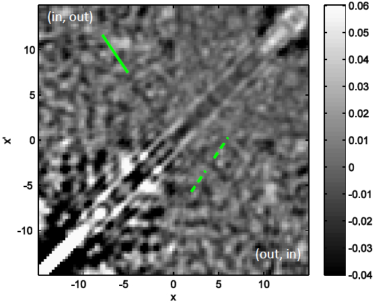
$x = V_{\mathrm{d2|out}}\ t$ correlates with $x' = V_{\mathrm{u|out}}\ t$

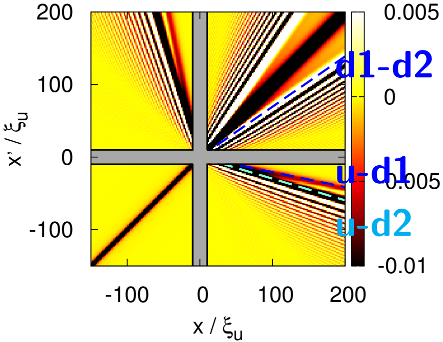
where $V_{\mathrm{d2|out}} = V_d - c_d$ and $V_{\mathrm{u|out}} = V_u - c_u$

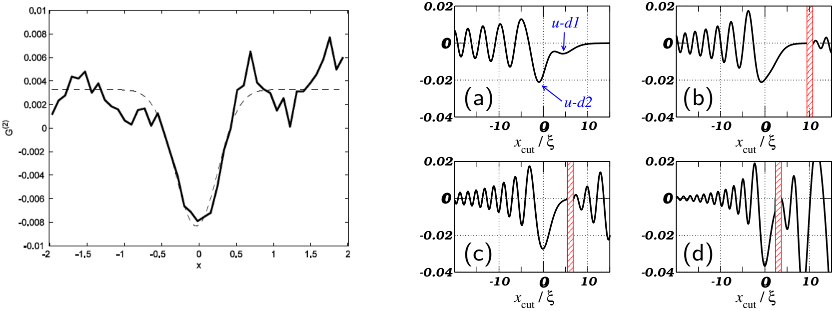


density profile near the horizon $\simeq$ waterfall $n_u/n_d = 5.55$ 5.55
$c_u/c_d = 2.4$ 2.36
$V_u/c_u = 0.375$ 0.4245 $V_d/c_d = 3.25$ 5.55

$T_H = 1.0$ nK	$T_H/(gn_u) = 0.36$? $T_H/(gn_u)\vert_{theo} \leq 0.25$



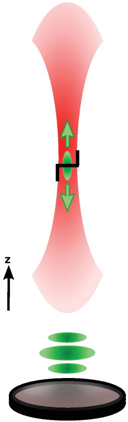


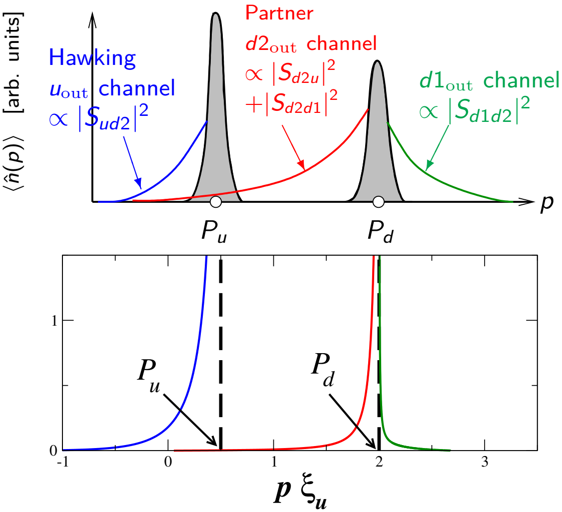


correlations $g_2(x, x')$ along a cut $x + x' = C^{\mathrm{st}}$. For all the plots: the abscissa is the coordinate x_{cut} along the cut in unit of $\xi = \sqrt{\xi_u \xi_d}$ and the ordinate is $\sqrt{n_u n_d \xi_u \xi_d}\, g_2(x, x')$. Left plot: experimental results of Steinhauer. Right plots: theoretical results in the waterfall configuration with $V_u/c_u = 0.4245$ along different cuts. Figs. (a), (b), (c) and (d): cases when the cut $x + x' = C^{\mathrm{st}}$ intercepts the $u - d2$ correlation lines at $x/\xi_u = 100$, 50, 30 and 15. The (red) shaded zone is the forbidden zone around $x' = 0$.

$T = 0$, adiabatic opening of the trap

Boiron *et al.* PRL (2015)

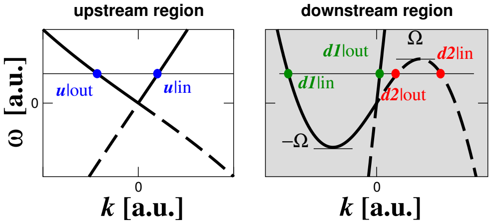




p, q : absolute momenta in units of ξ_u^{-1}

right plot: $g_2(p, q) \to$

where $g_2(p,q) = \dfrac{\langle : \hat{n}(p)\hat{n}(q) : \rangle}{\langle \hat{n}(p)\rangle\langle \hat{n}(q)\rangle}$

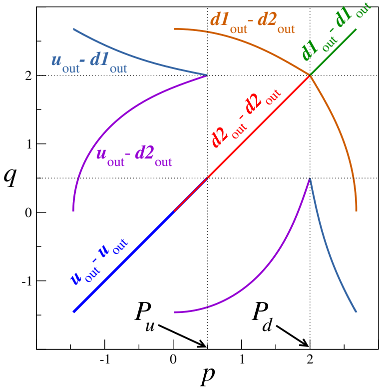


k : momentum relative to the condensate

$p = k + P_{(u/d)}$ where $P_{(u/d)} = mV_{(u/d)}$

$T = 0$ adiabatic opening

Boiron *et al.* PRL (2015)



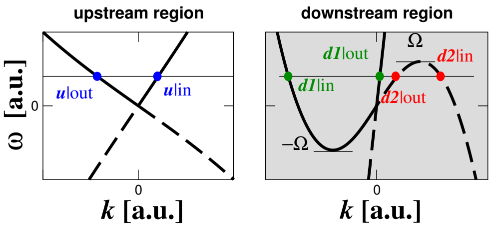
without horizon: $g_2 \equiv 1$

Two body momentum distribution in the presence of a horizon

p, q : absolute momenta in units of ξ_u^{-1}

right plot: $g_2(p,q) \rightarrow$

where $g_2(p,q) = \dfrac{\langle : \hat{n}(p)\hat{n}(q) : \rangle}{\langle \hat{n}(p) \rangle \langle \hat{n}(q) \rangle}$

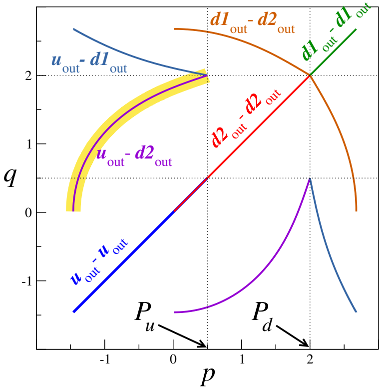


k : momentum relative to the condensate

$p = k + P_{(u/d)}$ where $P_{(u/d)} = mV_{(u/d)}$

$T = 0$ adiabatic opening

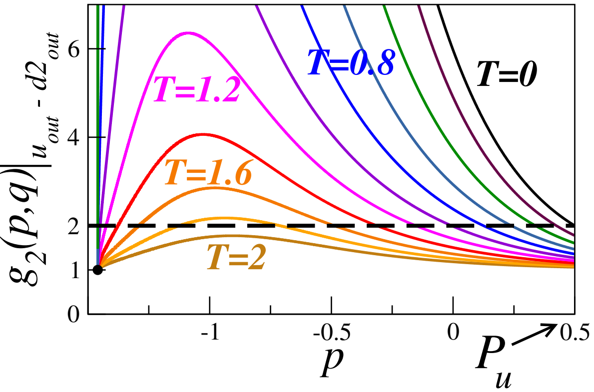
Boiron *et al.* PRL (2015)



without horizon: $g_2 \equiv 1$

$$\text{C.-S. violation}: \; g_2(p,q)\Big|_{u_\text{out}-d2_\text{out}} > \sqrt{g_2(p,p)\Big|_{u_\text{out}} \times g_2(q,q)\Big|_{d2_\text{out}}} \equiv 2$$

Boiron *et al.* PRL (2015)



T in units of μ

$T_H = 0.13$

$V_u/c_u = 0.5$

$V_d/c_d = 4$

$V_d/V_u = 4$

$n_u/n_d = 4$

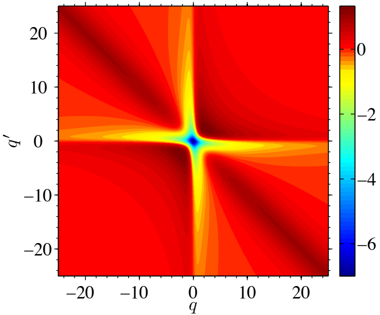
The NLS $\leftrightarrow$ Gross-Pitaevskii eq. is a nonlinear **quantum field** eq. :

$$-\tfrac{1}{2}\partial_x^2\hat{\psi} + g\,\hat{\psi}^\dagger\hat{\psi}\,\hat{\psi} = i\,\partial_t\hat{\psi}\ , \quad \text{with} \quad \left[\hat{\psi}(x,t),\hat{\psi}^\dagger(y,t)\right] = \delta(x-y)\ .$$

BEC : macroscopic occupation of the lowest quantum state: $\hat{\psi}(x,t) = \underline{\psi_{(0)}(x,t)} + \underline{\hat{\phi}(x,t)}$ (Bogoliubov 1947)

$\psi_{(0)}$	: solution of the (classical) NLS
$\hat{\phi}$	: solution of a linearized (quantum) eq.

makes it possible to consider vacuum fluctuations. In particular : **Hawking radiation** in a stationary, non uniform setting.



Mathey, Vishwanath, Altman, PRA (2009)

Bouchoule, Arzamasovs, Kheruntsyan, Gangardt, PRA (2012)

$$\hat{\phi}(x) = e^{iP_{(u/d)}x} \int_0^\infty \frac{d\omega}{\sqrt{2\pi}} \sum_{L\in\{U,D1\}} \left[u_L(x,\omega)\hat{a}_L(\omega) + v_L^*(x,\omega)\hat{a}_L^\dagger(\omega) \right]$$
$$+ \; e^{iP_{(u/d)}x} \int_0^\Omega \frac{d\omega}{\sqrt{2\pi}} \left[u_{D2}(x,\omega)\hat{a}_{D2}^\dagger(\omega) + v_{D2}^*(x,\omega)\hat{a}_{D2}(\omega) \right] .$$

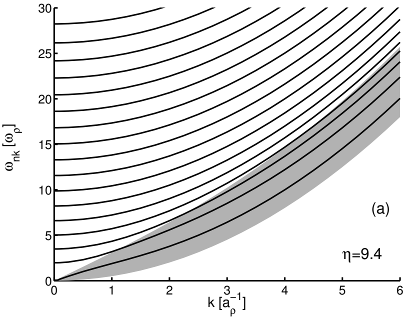
- If $x \ll -\xi_u$: $u_U(x) = \mathcal{U}_{u|\mathrm{in}} e^{iq_{u|\mathrm{in}}x} + S_{uu}\,\mathcal{U}_{u|\mathrm{out}} e^{iq_{u|\mathrm{out}}x}$,
- If $x \gg \;\; \xi_d$: $u_U(x) = S_{d1,u}\,\mathcal{U}_{d1|\mathrm{out}} e^{iq_{d1|\mathrm{out}}x} + S_{d2,u}\,\mathcal{U}_{d2|\mathrm{out}} e^{iq_{d2|\mathrm{out}}x}$.

adiabatic opening of the trap: $\begin{pmatrix} \mathcal{U}(\omega) \\ \mathcal{V}(\omega) \end{pmatrix}_{\mathrm{mode}} \to \begin{pmatrix} 1 \\ 0 \end{pmatrix}$ or $\begin{pmatrix} 0 \\ 1 \end{pmatrix}$ for $d2|out$

see also: de Nova, Sols & Zapata PRA (2014)

- adiabaticity **always violated** for long wave-lengths, when $\omega \times t_{\mathrm{char}} \ll 1$

when $\hbar\omega_\perp \leq \mu$:



Zaremba, PRA (1998)

Stringari, PRA (1998)

Fedichev & Shlyapnikov, PRA (2001)

Tozzo & Dalfovo, PRA (2002)

modified dispersion relation :

$$\omega_0^2(q) = c_{1d}^2\, q^2 \left(1 - \tfrac{1}{48}(qR_\perp)^2 + \ldots\right)$$

new channels :

$$\omega_{n\geq 1}^2(q) = 2n(n+1)\,\omega_\perp^2 + \tfrac{1}{4}(qR_\perp\omega_\perp)^2 + \ldots$$

these new channels will be populated

at $T = 0$

mass term $\neq$ Klein-Gordon

$\rightarrow$ new "in" modes

BECs offer interesting prospects to observe analogous Hawking radiation

[Steinhauer, Nature Physics]

general perspective : **quantum effects** with nonlinear **matter** waves

One- and two-body momentum distributions accessible by present day experimental techniques provide clear direct evidences

- of the occurrence of a sonic horizon.
- of the associated acoustic Hawking radiation.
- of the quantum nature of the Hawking process.
  - ☺ The signature of the quantum behavior persists even at temperatures larger than the chemical potential.

\end{aligned}$$

$$\begin{aligned}
0 \leq \langle \delta n^2 \rangle &\stackrel{def}{=} \langle \hat{n}^2 \rangle - \langle \hat{n} \rangle^2 \\
&= \underbrace{\langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle - \langle \hat{n} \rangle^2}_{sign?} + \langle \hat{n} \rangle
\end{aligned}$$

Cauchy-Schwarz: $|\langle \hat{\boldsymbol{A}} \rangle|^2 \leq \langle \hat{\boldsymbol{A}}^\dagger \hat{\boldsymbol{A}} \rangle$

Hence	$|\langle \hat{a}\hat{a} \rangle|^2 \leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle$
But	$|\langle \hat{a}^\dagger \hat{a} \rangle|^2 \not\leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle$

$\langle ... \rangle \stackrel{def}{=} \mathrm{Tr}(\rho ...)$

$$\begin{aligned} \langle \hat{n}^2 \rangle &= \langle \hat{a}^\dagger \hat{a} \hat{a}^\dagger \hat{a} \rangle \\ &= \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle + \langle \hat{a}^\dagger 1\, \hat{a} \rangle \\ &= \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle + \langle \hat{n} \rangle \end{aligned}$$

$$\begin{aligned} 0 \leq \langle \delta n^2 \rangle &\stackrel{def}{=} \langle \hat{n}^2 \rangle - \langle \hat{n} \rangle^2 \\ &= \underbrace{\langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle - \langle \hat{n} \rangle^2}_{sign?} + \langle \hat{n} \rangle \end{aligned}$$

Cauchy-Schwarz: $|\langle \hat{\boldsymbol{A}} \rangle|^2 \leq \langle \hat{\boldsymbol{A}}^\dagger \hat{\boldsymbol{A}} \rangle$

Hence	$\lvert\langle \hat{a} \hat{a} \rangle\rvert^2 \leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle$
But	$\lvert\langle \hat{a}^\dagger \hat{a} \rangle\rvert^2 \not\leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle$

stupid theoretical example

average over a number state: $\rho \equiv |n\rangle\langle n|$

$$\begin{aligned} \langle \hat{a} \hat{a} \rangle^2 &= 0 \\ \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle &= n(n-1) \\ \langle \hat{a}^\dagger \hat{a} \rangle^2 &= n^2 \not\leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle \end{aligned}$$

a number state is clearly sub-Poissonian !

$\langle \ldots \rangle \stackrel{def}{=} \mathrm{Tr}(\rho \ldots)$

$$\begin{aligned}\langle \hat{n}^2 \rangle &= \langle \hat{a}^\dagger \hat{a} \hat{a}^\dagger \hat{a} \rangle \\ &= \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle + \langle \hat{a}^\dagger 1\, \hat{a} \rangle \\ &= \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle + \langle \hat{n} \rangle\end{aligned}$$

$$\begin{aligned}0 \leq \langle \delta n^2 \rangle &\stackrel{def}{=} \langle \hat{n}^2 \rangle - \langle \hat{n} \rangle^2 \\ &= \underbrace{\langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle - \langle \hat{n} \rangle^2}_{sign?} + \langle \hat{n} \rangle\end{aligned}$$

Cauchy-Schwarz: $|\langle \hat{\boldsymbol{A}} \rangle|^2 \leq \langle \hat{\boldsymbol{A}}^\dagger \hat{\boldsymbol{A}} \rangle$

Hence	$\lvert\langle \hat{a}\hat{a} \rangle\rvert^2 \leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle$
But	$\lvert\langle \hat{a}^\dagger \hat{a} \rangle\rvert^2 \not\leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle$

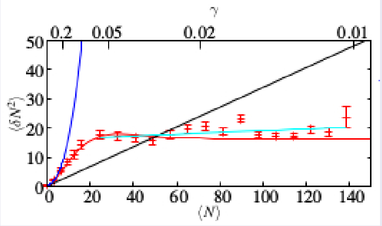
stupid theoretical example

average over a number state: $\rho \equiv |n\rangle\langle n|$

$$\begin{aligned}\langle \hat{a}\hat{a} \rangle^2 &= 0 \\ \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle &= n(n-1) \\ \langle \hat{a}^\dagger \hat{a} \rangle^2 &= n^2 \not\leq \langle \hat{a}^\dagger \hat{a}^\dagger \hat{a}\, \hat{a} \rangle\end{aligned}$$

a number state is clearly sub-Poissonian !

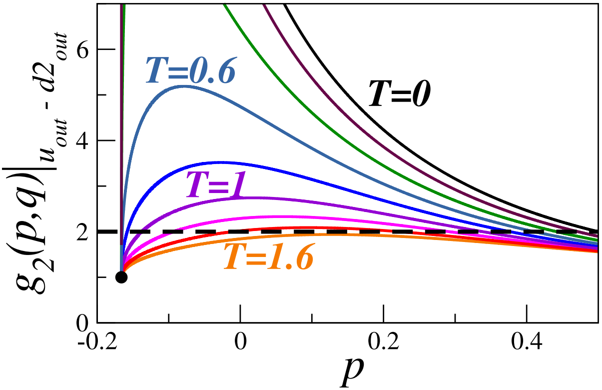
experimental results



Poissonian limit : $\langle \delta N^2 \rangle = 0.34 \langle N \rangle$
Ideal Bose gas
Yang-Yang
Quasi-cond.

Jacqmin *et al., PRL (2011)*

C.-S. violation : $g_2(p,q)\Big|_{u_{\rm out}-d2_{\rm out}} > \sqrt{g_2(p,p)\Big|_{u_{\rm out}} \times g_2(q,q)\Big|_{d2_{\rm out}}} \equiv 2$



T in units of μ

$T_H = 0.12$

$V_u/c_u = 0.5$

$V_d/c_d = 1.83$

$V_d/V_u = 2.34$

$n_u/n_d = 2.37$

Schützhold and Unruh, Phys. Rev. D (2002)

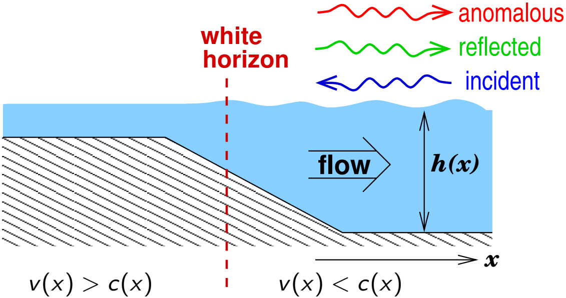
Rousseaux *et al.*, New Journal of Physics (2008)

Weinfurtner *et al.*, Phys. Rev. Lett. (2011)

Euvé *et al.*, Phys. Rev. D (2016)

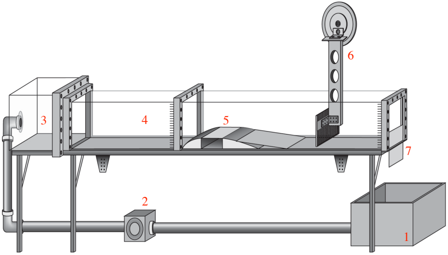
in a basin of depth h, the dispersion relation of gravity waves is $(\omega - Vk)^2 = g\,k\,\tanh(k\,h)$, corresponding to $c = \sqrt{g\,h}$

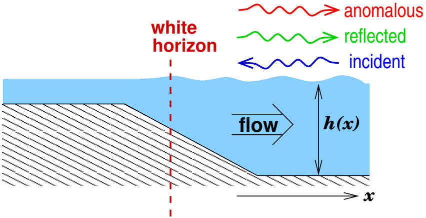
Experimental test of mode conversion :

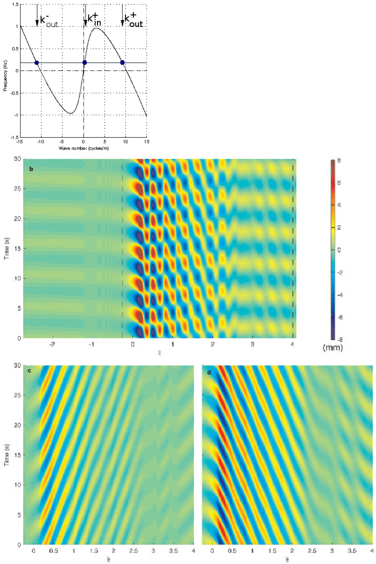


Vancouver experiment

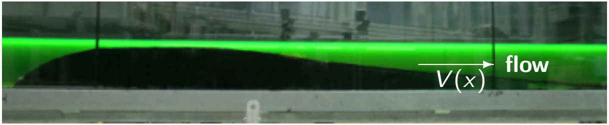
Weinfurtner *et al.*, Phys. Rev. Lett. (2011)



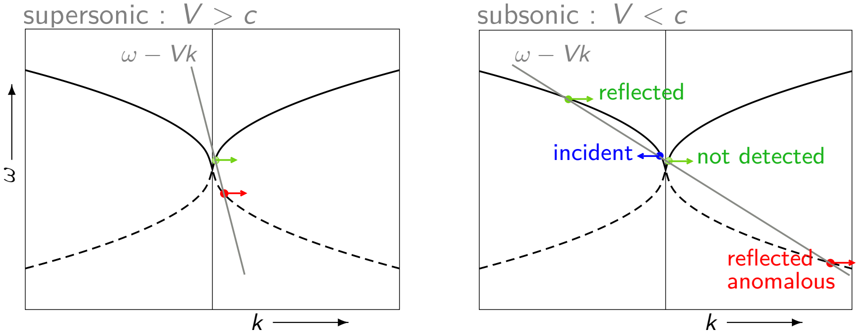




$$\omega - Vk = \pm\sqrt{gk\tanh(hk)}$$



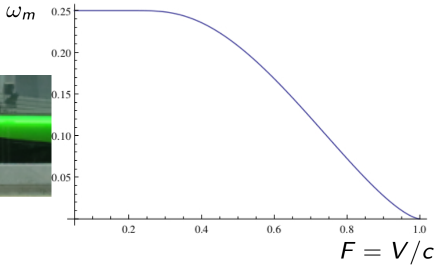
Poitiers experiment



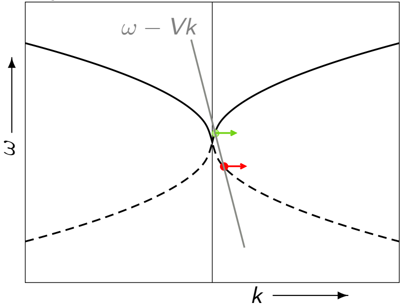
Euvé *et al.*, Phys. Rev. D (2016)

$$\omega - Vk = \pm\sqrt{gk\tanh(hk)}$$

Poitiers experiment



supersonic : $V > c$



subsonic : $V < c$
